XRPL Validator — Daily Engineering Report · 2026-08-29

Period: 2026-08-29 00:00 to 24:00 US Eastern (2026-08-29 04:00 to 2026-08-30 04:00 UTC); ledgers #106,614,344 to #106,636,601. Every count from the ledger and the validator's logs stops at #106,636,601. Generated 2026-10-21 00:47 EDT by report generator v3.0. Sources: the XRP Ledger (ledger headers and amendments, read from a reference rippled node), the validator's signing log and receipt logs, the deployment pipeline's gate, soak and health records, the git history of xrpl-validator and the XRPL Rust SDK, and data.xrpl.org. Scope: XRPL work only.

Revised on 2026-10-21 in report format v3; the original is kept in this repository's history. Built only from records that exist for this day. Available: the day's first and last ledger, from a public full-history server; Step 1 receipt records (they begin 2026-08-29); xrpl-validator merge records (they begin 2026-07-04). Not available: ledger headers (the reference node holds ledgers from 2026-10-04 22:52 UTC); signing records (they begin 2026-09-19); Steps 2–5 receipt records (they begin 2026-10-09); deployment records (they begin 2026-09-11); amendment data; data.xrpl.org agreement scores (scored days begin 2026-04-04; some days have none).

Status

Not assessed — no signing records for this day.

Criteria. Normal: coverage outside planned maintenance at or above the 99.9% objective, every validation agreed with the network's validated ledger, and no engine receipt is open. Degraded: coverage below the objective, or an open engine receipt. Impaired: any validation that disagreed with the network, or coverage below 90%.

Executive summary

- **Validator:** no signing records for this day (they begin 2026-09-19).
- **Native engine:** 5,740 engine receipts recorded (5 fixed, 0 explained, 5735 without a recorded fix).
- **Changes:** 0 deployments, 337 commits merged into main.

Service levels

No signing records for this day (they begin 2026-09-19).

Native engine conformance

Earlier FFI shadow log (libxrpl applied against the validator's mirror; superseded by Step 1): 41 transaction-level differences recorded this day, across 1 ledger. These were not triaged into receipts.

Ledgers with a receipt in the period (#106,614,344–#106,636,601), by step:

Step	Ledgers with a receipt
Step 1 · native engine	5,740
Step 2 · records	0
Step 3 · order	0
Step 4 · peer data	0
Step 4 · validations	0
Step 5 · own hash	0
Writer	0

Live counters are kept only for the current run; none exist for a past day.

Receipt register

ID	Time	Ledger(s)	Step	Description	Disposition
R-01	—	#106,628,655	Step 1 · native engine	5 ledger change(s) the network made were absent from ours: 658B6007, 81F42591, EB722815; 175 object(s) differed in content	fixed: commit 02465de, deployed in cycle 121 (2026-09-11 17:39 UTC)
R-02	—	#106,628,656	Step 1 · native engine	3 transaction result(s) differed from rippled's; 17 ledger change(s) the network made were absent from ours: 2C56F2D4, 43C593F0, B3897466; 167 object(s) differed in content	no disposition recorded
R-03	—	#106,628,657	Step 1 · native engine	3 transaction result(s) differed from rippled's; 16 ledger change(s) the network made were absent from ours: 42848D6F, EB5E8DA7, 54536FA7; 2 change(s) of ours the network did not make; 127 object(s) differed in content	no disposition recorded
R-04	—	#106,628,658	Step 1 · native engine	7 ledger change(s) the network made were absent from ours: 693ACE6D, 587E2897, B7995E4C; 105 object(s) differed in content	no disposition recorded
R-05	—	#106,628,659	Step 1 · native engine	1 ledger change(s) the network made were absent from ours: 587E2897; 157 object(s) differed in content	no disposition recorded
R-06	—	#106,628,660	Step 1 · native engine	1 ledger change(s) the network made were absent from ours: 587E2897; 78 object(s) differed in content	no disposition recorded
R-07	—	#106,628,661	Step 1 · native engine	1 ledger change(s) the network made were absent from ours: 587E2897; 95 object(s) differed in content	no disposition recorded
R-08	—	#106,628,662	Step 1 · native engine	3 transaction result(s) differed from rippled's; 11 ledger change(s) the network made were absent from ours: 2C7B61C8, 59EDFBD7, 225123D5; 185 object(s) differed in content	no disposition recorded
R-09	—	#106,628,663	Step 1 · native engine	14 ledger change(s) the network made were absent from ours: D38782E6, BAA627C4, B99C756C; 165 object(s) differed in content	no disposition recorded
R-10	—	#106,628,664	Step 1 · native engine	17 ledger change(s) the network made were absent from ours: 587E2897, 693ACE6D, 52B1A1FB; 137 object(s) differed in content	no disposition recorded
R-11	—	#106,628,665	Step 1 · native engine	1 transaction result(s) differed from rippled's; 10 ledger change(s) the network made were absent from ours: CA82F2D4, 736CC892, 318E00F1; 119 object(s) differed in content	no disposition recorded
R-12	—	#106,628,666	Step 1 · native engine	3 transaction result(s) differed from rippled's; 16 ledger change(s) the network made were absent from ours: 9B15021A, 07CFE576, E1B0330A; 170 object(s) differed in content	no disposition recorded

ID	Time	Ledger(s)	Step	Description	Disposition
R-13	—	#106,628,667	Step 1 · native engine	1 transaction result(s) differed from rippled's; 8 ledger change(s) the network made were absent from ours: C65E8887, 587E2897, E7C799A8; 234 object(s) differed in content	no disposition recorded
R-14	—	#106,628,668	Step 1 · native engine	21 transaction result(s) differed from rippled's; 67 ledger change(s) the network made were absent from ours: BD2E4D9C, 8099AB36, 38A5F4A4; 185 object(s) differed in content	no disposition recorded
R-15	—	#106,628,669	Step 1 · native engine	4 transaction result(s) differed from rippled's; 16 ledger change(s) the network made were absent from ours: A64DC21A, 0329C3A4, FE62A06F; 211 object(s) differed in content	no disposition recorded
R-16	—	#106,628,670	Step 1 · native engine	8 ledger change(s) the network made were absent from ours: D70B5859, A39FB344, 587E2897; 95 object(s) differed in content	no disposition recorded
R-17	—	#106,628,671	Step 1 · native engine	2 transaction result(s) differed from rippled's; 8 ledger change(s) the network made were absent from ours: 9935C581, 8099AB36, A39FB344; 165 object(s) differed in content	no disposition recorded
R-18	—	#106,628,672	Step 1 · native engine	3 transaction result(s) differed from rippled's; 10 ledger change(s) the network made were absent from ours: B687937A, F49B9DF3, 05C81F22; 96 object(s) differed in content	no disposition recorded
R-19	—	#106,628,673	Step 1 · native engine	1 transaction result(s) differed from rippled's; 8 ledger change(s) the network made were absent from ours: CF75E0DD, 51815A5E, 55BF1357; 226 object(s) differed in content	no disposition recorded
R-20	—	#106,628,674	Step 1 · native engine	3 transaction result(s) differed from rippled's; 33 ledger change(s) the network made were absent from ours: CA82F2D4, 2307B493, 46C3DCF8; 318 object(s) differed in content	no disposition recorded
R-21	—	#106,628,675	Step 1 · native engine	2 transaction result(s) differed from rippled's; 22 ledger change(s) the network made were absent from ours: 2307B493, D70B5859, 983AC373; 3 change(s) of ours the network did not make; 144 object(s) differed in content	no disposition recorded
R-22	—	#106,628,676	Step 1 · native engine	12 transaction result(s) differed from rippled's; 39 ledger change(s) the network made were absent from ours: 3CC5FA6F, 501F1F51, 47AAD0B9; 128 object(s) differed in content	no disposition recorded
R-23	—	#106,628,677	Step 1 · native engine	10 transaction result(s) differed from rippled's; 35 ledger change(s) the network made were absent from ours: C65E8887, 2C3B0979, 3FD4509D; 151 object(s) differed in content	no disposition recorded
R-24	—	#106,628,678	Step 1 · native engine	5 ledger change(s) the network made were absent from ours: 388BD9AD, FAA03B09, BC5BD16A; 3 change(s) of ours the network did not make; 198 object(s) differed in content	no disposition recorded
R-25	—	#106,628,679	Step 1 · native engine	14 transaction result(s) differed from rippled's; 44 ledger change(s) the network made were absent from ours: F1FFD315, 58E4854F, D5F1E1B1; 145 object(s) differed in content	no disposition recorded
R-26	—	#106,628,680	Step 1 · native engine	1 ledger change(s) the network made were absent from ours: E170E746; 250 object(s) differed in content	no disposition recorded
R-27	—	#106,628,681	Step 1 · native engine	19 ledger change(s) the network made were absent from ours: 653B451D, 5EDA5EF8, 2628253F; 134 object(s) differed in content	no disposition recorded
R-28	—	#106,628,682	Step 1 · native engine	3 transaction result(s) differed from rippled's; 13 ledger change(s) the network made were absent from ours: E9DC19EF, 1EBB45D4, 87151D52; 129 object(s) differed in content	no disposition recorded
R-29	—	#106,628,683	Step 1 · native engine	16 transaction result(s) differed from rippled's; 53 ledger change(s) the network made were absent from ours: 36BFDF44, 7CC7C676, 25E1118A; 129 object(s) differed in content	no disposition recorded
R-30	—	#106,628,684	Step 1 · native engine	5 ledger change(s) the network made were absent from ours: 9F07A9F0, 54FD9EB6, 77E8BAB9; 131 object(s) differed in content	no disposition recorded

ID	Time	Ledger(s)	Step	Description	Disposition
R-31	—	#106,628,685	Step 1 · native engine	11 ledger change(s) the network made were absent from ours: 26A9A945, 649F2452, 587E2897; 179 object(s) differed in content	no disposition recorded
R-32	—	#106,628,686	Step 1 · native engine	37 ledger change(s) the network made were absent from ours: B59491DC, 658B6007, 8D6987B3; 234 object(s) differed in content	no disposition recorded
R-33	—	#106,628,687	Step 1 · native engine	5 ledger change(s) the network made were absent from ours: CC859C2B, 269C68ED, 3E7BFC4B; 93 object(s) differed in content	no disposition recorded
R-34	—	#106,628,688	Step 1 · native engine	29 transaction result(s) differed from rippled's; 90 ledger change(s) the network made were absent from ours: FA28242A, 6EB28A76, A04C4F6C; 161 object(s) differed in content	no disposition recorded
R-35	—	#106,628,689	Step 1 · native engine	10 transaction result(s) differed from rippled's; 33 ledger change(s) the network made were absent from ours: 388BD9AD, 1A98B1B0, FAA03B09; 157 object(s) differed in content	no disposition recorded
R-36	—	#106,628,690	Step 1 · native engine	3 ledger change(s) the network made were absent from ours: 587E2897, 59EDFBD7, BC7688D1; 109 object(s) differed in content	no disposition recorded
R-37	—	#106,628,691	Step 1 · native engine	16 ledger change(s) the network made were absent from ours: 9F07A9F0, F77A49F5, 54FD9EB6; 235 object(s) differed in content	no disposition recorded
R-38	—	#106,628,692	Step 1 · native engine	1 transaction result(s) differed from rippled's; 18 ledger change(s) the network made were absent from ours: BC5BD16A, 08AAE23D, 269C68ED; 259 object(s) differed in content	no disposition recorded
R-39	—	#106,628,693	Step 1 · native engine	11 transaction result(s) differed from rippled's; 40 ledger change(s) the network made were absent from ours: 95938CC9, 2307B493, 94FD9EBB; 121 object(s) differed in content	no disposition recorded
R-40	—	#106,628,694	Step 1 · native engine	1 transaction result(s) differed from rippled's; 10 ledger change(s) the network made were absent from ours: FAA03B09, 05FA8ED2, 2120A713; 3 change(s) of ours the network did not make; 167 object(s) differed in content	no disposition recorded

A receipt is recorded whenever the validator's own work differs from the network's, or the network's trusted validations reached it short of quorum. One ledger flagged by several steps is one receipt. Dispositions: fixed (with the finding, commit and deployment), explained (not a defect, with the reason), or open. Receipt and incident IDs are numbered per report: R-01 here is R-2026-08-29-01, INC-01 is INC-2026-08-29-01. Times are not shown where the reference node no longer holds the ledger.

5,700 more receipts (#106,628,695–#106,636,057) are in the record and not listed individually; their dispositions: 4 fixed, 5,696 no disposition recorded.

Incidents

Not assessed: no signing records for this day.

Change log

Deployments

No deployment records before 2026-09-11.

Merged into main

Merged	Repo	Commit	Subject
19:03 UTC	xrpl-validator	`c9dc9c2`	feat(xrpl-node): XRPL_REPLAY_TIMING=1 — per-ledger apply/hash phase receipts
19:03 UTC	xrpl-validator	`06c8658`	Merge branch 'loop/differential-harness'
19:03 UTC	xrpl-validator	`84b245c`	fix(xrpl-ledger): NFT transfer-fee royalty rounds half-even, not floor
19:03 UTC	xrpl-validator	`dffa32c`	fix(xrpl-node): probe fallback triggers on 'internal' — rippled masks lgrNotFound for non-admin
19:03 UTC	xrpl-validator	`46f139b`	feat(xrpl-ledger): BookStep requireAuth — unauth owners reaped, unauth pools yield no synthetic
19:03 UTC	xrpl-validator	`24c2d93`	fix(xrpl-node): probe s2 fallback retries transient failures
19:03 UTC	xrpl-validator	`1478907`	fix(xrpl-ledger): AMMVote applyVote ported for real — wrapped VoteEntry, VoteWeight from live LP balances, lowest-weight eviction, weighted-average TradingFee
19:03 UTC	xrpl-validator	`6d90a33`	revert(xrpl-ledger): back out the sell-trailing walk pending whole-offer-trial rev semantics — the probe hydration seed stays
19:03 UTC	xrpl-validator	`e6f0192`	fix(xrpl-ledger): a tfSell crossing's stream trails the whole in-limit book — trial past live offers, reap the dead — and probe book hydration seeds at the book base
19:03 UTC	xrpl-validator	`42616e0`	fix(xrpl-ledger): a missing escrow is tecNO_TARGET, not tecNO_ENTRY — EscrowFinish and EscrowCancel, all four sites
19:03 UTC	xrpl-validator	`f28a6eb`	fix(xrpl-ledger): AMM pool admission is context-dependent — fib-slice average under multiPath, raw spot single-path, keyed on iteration-entry multiPath — two hundred eighty consecutive ledgers
19:03 UTC	xrpl-validator	`527956b`	fix(xrpl-ledger): AccountSet asf-to-lsf is a table, not a shift — two hundred fifty-eight consecutive ledgers
19:03 UTC	xrpl-validator	`af8bd2f`	fix(xrpl-ledger): the strand ub composes hop-0 trIn and the final DirectI's issuing rate — two hundred forty consecutive ledgers
19:03 UTC	xrpl-validator	`390bff3`	fix(xrpl-ledger): the fwd chain carries the PRODUCED amount when the delta is exact, and a met-want hop flushes its excess input through the pool — two hundred thirty-nine consecutive ledgers
19:03 UTC	xrpl-validator	`d94dc7f`	fix(xrpl-ledger): strand admission is judged once per iteration — an un-attempted self-removal resets the level anchor — TWO HUNDRED TWENTY CONSECUTIVE LEDGERS, THE WHOLE FETCHED RANGE
19:03 UTC	xrpl-validator	`cbfc29a`	fix(xrpl-ledger): the crossing walk's remainingOut is StrandFlow's fold, never a running subtraction — two hundred seventeen consecutive ledgers
19:03 UTC	xrpl-validator	`7ec3a7c`	fix(xrpl-ledger): trustCreate NoRipple — creator side from the tx flags ONLY, peer side stamped when the PEER lacks DefaultRipple — two hundred eleven consecutive ledgers
19:03 UTC	xrpl-validator	`5485685`	fix(xrpl-ledger): the underfunded crossing clamp threads the balance as the walk's GROSS cap — two hundred six consecutive ledgers
19:03 UTC	xrpl-validator	`5d46894`	fix(xrpl-ledger): crossing removes self-offers past the strict threshold — but only in an ADMITTED strand — one hundred ninety-four consecutive ledgers
19:03 UTC	xrpl-validator	`8bef73f`	fix(xrpl-ledger): the delivered figure is rippled's actualOut — the sorted 16-digit fold, never an exact-width sum — one hundred ninety consecutive ledgers
19:03 UTC	xrpl-validator	`c88dc80`	fix(xrpl-ledger): tearing down a redeemed LP line charges ONLY the holder — one hundred eighty-six consecutive ledgers
19:03 UTC	xrpl-validator	`9885998`	fix(xrpl-ledger): a partial fib slice prices at the slice's CEIL-16 encoded quality — one hundred twenty consecutive ledgers, the range is clear
19:03 UTC	xrpl-validator	`737f067`	fix(xrpl-ledger): every spend-side net division is mulRatio-NEAREST — the live-line clamp was the fourth and last floor — one hundred sixteen consecutive ledgers
19:03 UTC	xrpl-validator	`afb53c1`	fix(xrpl-ledger): a book strand's sin is GROSS — the round loop drained the NET pot with it — one hundred seven consecutive ledgers

Merged	Repo	Commit	Subject
19:03 UTC	xrpl-validator	`b14b09a`	fix(xrpl-ledger): direct and run-tail asks take the NET twin verbatim — dividing the gross pot cannot recover it — eighty-four consecutive ledgers
19:03 UTC	xrpl-validator	`3b38011`	fix(xrpl-ledger): merge_pages sorts by compare_tokens, not whole-ID hex — eighty-one consecutive ledgers
19:03 UTC	xrpl-validator	`e4c1581`	fix(xrpl-ledger): the hop-joint net division is mulRatio-NEAREST, not floor — seventy-six consecutive ledgers
19:03 UTC	xrpl-validator	`a12ffd5`	fix(xrpl-ledger): gross_in is mulRatio and in-limited fills are GROSS-PRIMARY — the coupled spend-side campaign, seventy-five consecutive ledgers
19:03 UTC	xrpl-validator	`d882679`	fix(xrpl-ledger): a zero hop-carry delta with nonzero walk-accounting is a BLIND delta, not a dry hop — the self-fill face
19:03 UTC	xrpl-validator	`677f310`	feat(xrpl-ledger): limitOut quality-function trim, net-units judge, and per-iteration NET destination credits — seventy-two consecutive ledgers
19:03 UTC	xrpl-validator	`dae7e88`	fix(xrpl-ledger): payment remainders from savedOuts totals; want_gross via mulRatio; fee trim reuses the rev cache — sixty-seven consecutive ledgers
19:03 UTC	xrpl-validator	`4cffac5`	fix(xrpl-ledger): tfSell residual gets rounds half-even, not truncated — fifty-four consecutive ledgers
19:03 UTC	xrpl-validator	`808c980`	fix(xrpl-ledger): tecKILLED discards the OfferSequence cancel — fifty-three consecutive ledgers
19:03 UTC	xrpl-validator	`84a026e`	fix(xrpl-ledger): fwd hops reuse rev-stamped debt directions — fifty consecutive ledgers
19:03 UTC	xrpl-validator	`090b551`	fix(xrpl-ledger): a book redeems into the run behind it — forty-six consecutive ledgers
19:03 UTC	xrpl-validator	`84e17e0`	fix(xrpl-ledger): settle the taker once per quality level, not per fill — forty-four consecutive ledgers
19:03 UTC	xrpl-validator	`36feb4f`	fix(xrpl-ledger): tec rolls back the AccountTxnID stamp; delivery trim rounds nearest — forty consecutive ledgers
19:03 UTC	xrpl-validator	`fb798b3`	fix(xrpl-ledger): mulRatio requirements + blind-measurement guards — seventeen consecutive ledgers
19:03 UTC	xrpl-validator	`f37bf9d`	fix(xrpl-ledger): fresh multi-path verdict before the AMM turn — nine consecutive ledgers
19:03 UTC	xrpl-validator	`436102d`	fix(xrpl-ledger): single-path re-arbitration in the bridge controller — seven consecutive ledgers
19:03 UTC	xrpl-validator	`b7831e7`	fix(xrpl-ledger): four fill-precision fixes — six consecutive ledgers byte-for-byte
19:03 UTC	xrpl-validator	`26b2e2d`	fix(xrpl-ledger): tfSell residual rests the subtracted in-side, repriced out
19:03 UTC	xrpl-validator	`e84d0b3`	fix(xrpl-ledger): six mainnet-parity fixes from full-ledger replay rounds 2-3
19:03 UTC	xrpl-validator	`83858f9`	feat(node): state_replay — full-ledger native replay vs mainnet account_hash
19:03 UTC	xrpl-validator	`05de843`	feat(xrpl-node): state_verify — snapshot-dir account_hash verification
19:03 UTC	xrpl-validator	`9475a92`	fix(xrpl-ledger): self-cross deletions roll back with a failed strand — dead reaps stay banked
19:03 UTC	xrpl-validator	`1083ba5`	feat(xrpl-ledger): pseudo-transactions + flag-ledger NegativeUNL rotation — phase 4 opens
19:03 UTC	xrpl-validator	`1733d67`	feat(xrpl-ledger): byte backlog to ZERO — 98→0, ten fixtures byte-exact
19:03 UTC	xrpl-validator	`a0b42aa`	feat(xrpl-node): BYTE CENSUS — canonical-codec serialization vs ledger_entry binary=true

Merged	Repo	Commit	Subject
19:03 UTC	xrpl-validator	`6036cee`	feat(xrpl-ledger): XChain — all eight XLS-38 transactors; STUB_TYPES is EMPTY
19:03 UTC	xrpl-validator	`75b2517`	feat(xrpl-ledger): DID, PermissionedDomain, AMMClawback — five more stubs retired
19:03 UTC	xrpl-validator	`64ebb07`	feat(xrpl-ledger): MPT issuance lifecycle — Create/Destroy/Set/Authorize, stubs retired
19:03 UTC	xrpl-validator	`48367bc`	feat(xrpl-ledger): threadOwners — created/deleted nodes thread their owner roots
19:03 UTC	xrpl-validator	`9876271`	feat(xrpl-ledger): PreviousTxnID/PreviousTxnLgrSeq stamping + post-state threading census
19:03 UTC	xrpl-validator	`64c8246`	fix(xrpl-node): book hydration follows ledger_data markers — 400 pages, budgeted offers
19:03 UTC	xrpl-validator	`aa37f6b`	feat(xrpl-ledger): last-LP withdrawal deletes the AMM — lines, object, pool account
19:03 UTC	xrpl-validator	`1e9a2e4`	fix(xrpl-ledger): payment-mode AMM fills pay the IN-side transfer rate GROSS
19:03 UTC	xrpl-validator	`603a322`	fix(xrpl-ledger): model ISSUER-ONLY path elements (type 32) as same-currency cross-issuer books
19:03 UTC	xrpl-validator	`29b5ccb`	fix(xrpl-ledger): AMM offer generation reads pool balances ZERO-IF-FROZEN
19:03 UTC	xrpl-validator	`4ee4288`	feat(xrpl-ledger): anchored-slice bridged legs — single-path pool admission at SPOT, execution capped at the tip
19:03 UTC	xrpl-validator	`121869c`	feat(xrpl-ledger): MPT subsystem — direct MPT Payments and MPT Clawback
19:03 UTC	xrpl-validator	`56832be`	feat(xrpl-ledger): full PaymentChannel port — tfClose/tfRenew, expiry, keylet, hints
19:03 UTC	xrpl-validator	`2b1fc05`	fix(xrpl-ledger): engine-placed offers carry BookDirectory/BookNode/OwnerNode hints
19:03 UTC	xrpl-validator	`7965e2d`	fix(xrpl-ledger): four singles — CredentialAccept, SignerListSet, TrustSet, CheckCash
19:03 UTC	xrpl-validator	`6f72c88`	fix(xrpl-ledger): AMMWithdraw — LP line survives at zero unless default; issuer dir-tail hydration
19:03 UTC	xrpl-validator	`527b389`	fix(xrpl-ledger): NFT accept — seller-owns-token NoPermission, IOU-priced settlement, strict page bound
19:03 UTC	xrpl-validator	`e302884`	perf(xrpl-node): cache deterministic negative RPC lookups; share the HTTP client
19:03 UTC	xrpl-validator	`bb1ff88`	feat(xrpl-ledger): the flow driver — fib pace, zero-flow TER, consumed-trim stream, dead-level hydration
19:03 UTC	xrpl-validator	`520fc6b`	fix(xrpl-node): the probe recognizes threading-only ModifiedNodes that carry FinalFields
19:03 UTC	xrpl-validator	`46a9986`	fix(xrpl-ledger): tail admission is the residual-tip interval, not the anchored-slice quality
19:03 UTC	xrpl-validator	`09be43a`	fix(xrpl-ledger): a tfSell keeps taking pool liquidity after the pays minimum is met
19:03 UTC	xrpl-validator	`0a25745`	fix(xrpl-ledger): bridge peeks reap dead offers they step over once the strand is running
19:03 UTC	xrpl-validator	`cf9f395`	fix(xrpl-ledger): walk funding prices the reserve at the maker's first-peek OwnerCount
19:03 UTC	xrpl-validator	`60f425d`	fix(xrpl-ledger): the offer stream keeps reaping past the limit once the strand was built

Merged	Repo	Commit	Subject
19:03 UTC	xrpl-validator	`8f34f5c`	fix(xrpl-ledger): crossing tail AMM turn is gated by strand admission (anchored-at-limit ub × trIn)
19:03 UTC	xrpl-validator	`6f32591`	fix(xrpl-ledger): a skipped self-offer stays the tail AMM anchor; the trOut judge compose was wrong
19:03 UTC	xrpl-validator	`8d8079d`	fix(xrpl-ledger): single-path crossing lets the AMM emit unbounded when the limit beats the LOB tip
19:03 UTC	xrpl-validator	`0d4ce0f`	fix(xrpl-ledger): offer crossing judges the pass with the OUT issuer's transfer rate composed
19:03 UTC	xrpl-validator	`4771bdd`	feat(xrpl-ledger): the default path of a cross-issuer same-currency payment is a direct strand
19:03 UTC	xrpl-validator	`87bffeb`	feat(xrpl-ledger): DirectStepI stage 2 — direct runs composed with book hops
19:03 UTC	xrpl-validator	`f13ad50`	feat(xrpl-ledger): DirectStepI stage 1 — pure-account strands ripple for real
19:03 UTC	xrpl-validator	`b35031a`	docs: DirectStepI design — rippling through accounts, composed with book steps
19:03 UTC	xrpl-validator	`976d6e3`	fix(xrpl-ledger): AccountDelete has no OwnerCount rule — the directory walk decides
19:03 UTC	xrpl-validator	`24d983a`	fix(xrpl-ledger): AMMCreate preclaim — duplicate pool, reserve, funds, LP-token sides
19:03 UTC	xrpl-validator	`8c5e86b`	fix(xrpl-ledger): AMMWithdraw judges the DERIVED burn against the position, and the one-asset minimum
19:03 UTC	xrpl-validator	`442c34c`	fix(xrpl-ledger): TrustSet destination rules — no new lines at pseudo-accounts or opted-out issuers
19:03 UTC	xrpl-validator	`d57f139`	fix(xrpl-ledger): mint reserve gate must see the page insert too
19:03 UTC	xrpl-validator	`d86a69d`	fix(xrpl-ledger): an escrow whose deadline already passed is refused — and the token-escrow funds family
19:03 UTC	xrpl-validator	`d32160a`	fix(xrpl-ledger): OracleSet time rules — tecINVALID_UPDATE_TIME
19:03 UTC	xrpl-validator	`50d937e`	fix(xrpl-ledger): AMMVote refuses a voter who is not an LP
19:03 UTC	xrpl-validator	`c91e670`	fix(xrpl-ledger): AMMDeposit re-judges each ACTUAL amount before sending it
19:03 UTC	xrpl-validator	`2056087`	fix(xrpl-ledger): NFT accept judges the buyer's reserve when the transfer creates a page
19:03 UTC	xrpl-validator	`4ae3e03`	fix(xrpl-ledger): a mint that carries Amount inherits the OFFER's rules too
19:03 UTC	xrpl-validator	`12ddc7c`	fix: AMM zero-side refusal, NFTokenCancelOffer permissions, default-path book
19:03 UTC	xrpl-validator	`db5e428`	fix(xrpl-ledger): NoRipple on the destination's line blocks the step out of a book
19:03 UTC	xrpl-validator	`3e02ee6`	fix(xrpl-ledger): a credential is unlinked from BOTH directories, and the reserve follows acceptance
19:03 UTC	xrpl-validator	`92d8222`	fix(xrpl-ledger): cashing a check releases the check's own reserve
19:03 UTC	xrpl-validator	`39df833`	fix(xrpl-ledger): NFTokenModify checks mutability and the issuer's authorised minter
19:03 UTC	xrpl-validator	`74a4d42`	fix(xrpl-ledger): PaymentChannelCreate refuses DisallowIncomingPayChan and pseudo-accounts

Merged	Repo	Commit	Subject
19:03 UTC	xrpl-validator	`140d982`	fix(xrpl-ledger): a brokered accept must check BOTH offers' Destination
19:03 UTC	xrpl-validator	`2aa1274`	fix(xrpl-ledger): the bridged walk never crossed an expired offer either
19:03 UTC	xrpl-validator	`8ef6ea5`	feat(probe): DX_FILL on the bridged legs, and lift the saturating key cap
19:03 UTC	xrpl-validator	`6fb6cf7`	fix(xrpl-ledger): the strand upper bound charges the intermediate gateway's cut
19:03 UTC	xrpl-validator	`8e48764`	fix(xrpl-ledger): a pseudo-account cannot receive an escrow
19:03 UTC	xrpl-validator	`23f1153`	fix(xrpl-ledger): the balance clamps the GROSS, and a pass that misses limitQuality is discarded whole
19:03 UTC	xrpl-validator	`60c1d81`	docs(xrpl-ledger): renumber StrandFlow citations against 3.2.1
19:03 UTC	xrpl-validator	`8bbbae3`	docs(xrpl-ledger): cite 3.2.1, not the 3.1.3 vendor tree
19:03 UTC	xrpl-validator	`04d6c8b`	fix(xrpl-ledger): a terminal issuer-only change ripples between gateways, never a book
19:03 UTC	xrpl-validator	`a8b01c7`	fix(xrpl-ledger): a rested XRP residual rounds by mulRound, not by a plain ceiling
19:03 UTC	xrpl-validator	`1559d5f`	fix(xrpl-ledger): NFTokenBurn takes the token's OUTSTANDING OFFERS with it
19:03 UTC	xrpl-validator	`a31296a`	fix(xrpl-ledger): AccountDelete walks the owner DIRECTORY — OwnerCount 0 is not "owns nothing"
19:03 UTC	xrpl-validator	`91cdc47`	fix(xrpl-ledger): a tfSell FillOrKill completes on its FUNDED input, not on TakerGets
19:03 UTC	xrpl-validator	`e982148`	fix(xrpl-ledger): AMMWithdraw splits "no LP tokens" from "too few" — and the pool's own lines get hydrated
19:03 UTC	xrpl-validator	`51300d1`	feat(xrpl-ledger): DepositAuth — a payment needs the destination's permission
19:03 UTC	xrpl-validator	`b301e07`	fix(xrpl-ledger): AccountDelete removes the owner DIRECTORY, not just the account
19:03 UTC	xrpl-validator	`853e75a`	fix(xrpl-ledger): ceilOut CLAMPS the input to the offer's own, and either side at zero consumes it
19:03 UTC	xrpl-validator	`fbb4f96`	fix(harness): hydrate the NFT offer CREATOR's pages, not just the token's owner
19:03 UTC	xrpl-validator	`1a96950`	fix(xrpl-ledger): the AMM anchors only on a tip the taker could actually trade
19:03 UTC	xrpl-validator	`9c0d845`	fix(xrpl-ledger): NFTokenAcceptOffer weighs the buyer's funds — and the probe lets it see them
19:03 UTC	xrpl-validator	`950e63e`	fix(xrpl-ledger): every payment strand runs ONE PASS — corpus byte parity 0 hits
19:03 UTC	xrpl-validator	`bc756dd`	fix(xrpl-ledger): rippleSend moves the sender's line ONCE, with the gross
19:03 UTC	xrpl-validator	`ff1e752`	fix(xrpl-ledger): limitOut takes the STRICT canonicaliser when the drops decide
19:03 UTC	xrpl-validator	`7f8286b`	fix(xrpl-ledger): the bridge's direct head prices a partial fill at the filed rate
19:03 UTC	xrpl-validator	`4566c4e`	feat(xrpl-ledger): one AMM consumption per payment-engine iteration

Merged	Repo	Commit	Subject
19:03 UTC	xrpl-validator	`8d8d2e6`	fix(xrpl-ledger): ask the walk what a strand spent, don't difference the balance
19:03 UTC	xrpl-validator	`1f31546`	fix(xrpl-ledger): the precise measurement must account for the fee the walk debits
19:03 UTC	xrpl-validator	`45a7092`	fix(xrpl-ledger): measure the REVERSE pass's consumption precisely too
19:03 UTC	xrpl-validator	`afb133f`	fix(xrpl-ledger): reprice a rested remainder in BOTH directions
19:03 UTC	xrpl-validator	`44c20d9`	fix(xrpl-ledger): measure a hop's carry at full precision, not by differencing
19:03 UTC	xrpl-validator	`ca17418`	fix(xrpl-ledger): an INPUT-limited fill rounds the offer's output DOWN
19:03 UTC	xrpl-validator	`6798100`	fix(xrpl-ledger): stamount_signed_add ROUNDS its operands, not truncates
19:03 UTC	xrpl-validator	`070ca31`	fix(xrpl-ledger): reprice a rested remainder at the ENCODED ratio
19:03 UTC	xrpl-validator	`41ef4ac`	fix(xrpl-ledger): charge the input transfer fee once — the walk owns it
19:03 UTC	xrpl-validator	`e2a9c99`	fix(xrpl-ledger): price bridged fills at the filed BookDirectory rate
19:03 UTC	xrpl-validator	`4556384`	fix(xrpl-ledger): store offer residuals at STAmount precision, not exactly
19:03 UTC	xrpl-validator	`4a97124`	fix(xrpl-ledger): multiPath prices a clamped pool fill at the OFFER's quality
19:03 UTC	xrpl-validator	`cf36009`	fix(xrpl-ledger): the DIRECT walk charges the input issuer's transfer fee too
19:03 UTC	xrpl-validator	`81180a1`	fix(xrpl-ledger): withdraw-all pays two rounded steps, not a fused muldiv
19:03 UTC	xrpl-validator	`36a6fdb`	fix(xrpl-ledger): port rippled's Newton-iteration square root
19:03 UTC	xrpl-validator	`bbf6ee3`	fix(xrpl-ledger): a single-asset withdrawal pays what its adjusted tokens are worth
19:03 UTC	xrpl-validator	`e7183b3`	fix(xrpl-ledger): Number division DISCARDS its remainder at the 16-digit scale
19:03 UTC	xrpl-validator	`adca53a`	feat(xrpl-node): DX_VALCHECK compares EXACTLY, at STAmount precision
19:03 UTC	xrpl-validator	`df3c8f2`	fix(xrpl-ledger): an XRP residual ceils to whole DROPS, not to 16 digits
19:03 UTC	xrpl-validator	`6de2684`	fix(xrpl-ledger): to_amount honours round-to-NEAREST instead of flooring it
19:03 UTC	xrpl-validator	`94a028e`	fix(xrpl-ledger): a bridged taker pays the input issuer's transfer fee
19:03 UTC	xrpl-validator	`5c16b88`	fix(xrpl-ledger): a payment charges the input issuer's rate on EVERY hop
19:03 UTC	xrpl-validator	`dd4991a`	fix(xrpl-ledger): a fully-consumed offer transfers its own amounts verbatim
19:03 UTC	xrpl-validator	`5197c37`	fix(xrpl-ledger): a single-asset deposit pays what its adjusted tokens are worth
19:03 UTC	xrpl-validator	`c9ac386`	fix(xrpl-ledger): real LP token math for two-asset deposits and all withdrawals

Merged	Repo	Commit	Subject
19:03 UTC	xrpl-validator	`acf49ab`	fix(xrpl-ledger): quantize a deposit's LP mint to the pool balance's ulp
19:03 UTC	xrpl-validator	`85bb7df`	fix(xrpl-ledger): mint real LP tokens for AMMCreate and single-asset deposits
19:03 UTC	xrpl-validator	`25c9e31`	fix(xrpl-node): choose the hydration RPC per LEDGER, not per sweep script
19:03 UTC	xrpl-validator	`b2c47da`	fix(xrpl-ledger): match rippled's AMM slice sizing on direct offer crossing
19:03 UTC	xrpl-validator	`c99ebb2`	fix(xrpl-ledger): a payment pays the INPUT issuer's TransferRate
19:03 UTC	xrpl-validator	`07f2e32`	fix(xrpl-ledger): reprice bridged leg A after the mid-leg rounds up
19:03 UTC	xrpl-validator	`9bb5ceb`	fix(xrpl-ledger): the bridged XRP mid-leg must CEIL to whole drops, not truncate
19:03 UTC	xrpl-validator	`9e475fe`	feat(xrpl-ledger): DX_CLAMP — and it retires the ceil_in flip for good
19:03 UTC	xrpl-validator	`5aad67e`	fix(xrpl-node): prefetch NFT pages for NFTokenModify — it is tt 61, not 25..=29
19:03 UTC	xrpl-validator	`6ef30c4`	fix(xrpl-ledger): token escrow — Cancel and Finish never released the token
19:03 UTC	xrpl-validator	`c7d4625`	feat(xrpl-node): FFI_VALCHECK — the oracle rule now works at VALUE level
19:03 UTC	xrpl-validator	`0f55ba5`	fix(xrpl-ledger): rank payment strands by UPPER BOUND, not by a realised trial
19:03 UTC	xrpl-validator	`868cf89`	feat(xrpl-ledger): one strand per named path, and stop gating hops with the payment's limit
19:03 UTC	xrpl-validator	`a56ccbd`	fix(xrpl-ledger): NFTokenCreateOffer never charged for the object it creates
19:03 UTC	xrpl-validator	`850da82`	fix(xrpl-ledger): a rested residual keeps its ORIGINAL quality in its AMOUNTS
19:03 UTC	xrpl-validator	`9bc95c8`	feat(xrpl-node): DX_VALCHECK — compare the VALUES we wrote, not just the keys
19:03 UTC	xrpl-validator	`5dc7cb7`	fix(xrpl-ledger): a bridge leg-B maker cannot deliver more than it holds
19:03 UTC	xrpl-validator	`125be81`	fix(xrpl-ledger): size the reverse-pass grant to the requirement it measures
19:03 UTC	xrpl-validator	`7d785ec`	fix(xrpl-ledger): tfNoRippleDirect forbids the strand we fall back to
19:03 UTC	xrpl-validator	`89bed1e`	fix(xrpl-ledger): the reverse pass must size for the pass the forward one runs
19:03 UTC	xrpl-validator	`b569fa9`	fix(xrpl-ledger): destination checks across every transactor that has them
19:03 UTC	xrpl-validator	`3033135`	fix(xrpl-ledger): limitOut sizes a pass TO the limit — #106134431 closed 122/122
19:03 UTC	xrpl-validator	`3180e04`	fix(xrpl-ledger): single-path AMM takes maxOffer, clamped through the pool BOTH ways
19:03 UTC	xrpl-validator	`a171405`	feat(xrpl-ledger): max_offer — rippled's single-path AMM slice, trace-exact
19:03 UTC	xrpl-validator	`8d8ca2d`	fix(xrpl-ledger): a payment crosses the payer's own offer

Merged	Repo	Commit	Subject
19:03 UTC	xrpl-validator	`5626357`	fix(xrpl-ledger): destination checks come before the funding check
19:03 UTC	xrpl-validator	`17a99ef`	refactor(xrpl-ledger): remove DX_SEL — it now compares an abandoned model
19:03 UTC	xrpl-validator	`60fb653`	fix(xrpl-node): prefetch the NFT offer's OWNER — the accept names it by hash
19:03 UTC	xrpl-validator	`a191b79`	fix(xrpl-node): the FFI oracle replayed every old fixture under TODAY'S rules
19:03 UTC	xrpl-validator	`751d5d4`	test(xrpl-ledger): the 3 red regression tests encoded a 10 XRP reserve
19:03 UTC	xrpl-validator	`f2d9d9a`	feat(xrpl-ledger): DX_ULP — the 1-ulp upper bound is unobservable, and the note was backwards
19:03 UTC	xrpl-validator	`a836f94`	fix(xrpl-ledger): a rejected candidate's offer removals must survive its rollback
19:03 UTC	xrpl-validator	`03c2cb9`	fix(xrpl-ledger): strand selection — upper-bound order with fall-through
19:03 UTC	xrpl-validator	`005ad9a`	fix(xrpl-ledger): the bridge strand's upper bound must not charge the transfer fee
19:03 UTC	xrpl-validator	`dbb9110`	feat(xrpl-ledger): DX_SEL — measure strand selection against rippled's model
19:03 UTC	xrpl-validator	`f3f8b98`	fix(xrpl-ledger): auth is not an interest in a trust line
19:03 UTC	xrpl-validator	`44d7a1c`	fix(ledger): a hydrated maker with no line for what it sells holds ZERO
19:03 UTC	xrpl-validator	`cae6b85`	fix(probe): a dropped fetch is not a divergence — withhold the verdict
19:03 UTC	xrpl-validator	`7ff7a13`	fix(ledger): price an IN-limited fill through the encoded quality too
19:03 UTC	xrpl-validator	`178e853`	fix(ledger): one flow-wide AMM fib counter in cross_bridged, not one per leg
19:03 UTC	xrpl-validator	`c89601c`	fix(probe): load the tail's predecessor page, and compare pointers by VALUE
19:03 UTC	xrpl-validator	`64dc440`	fix(ledger): per-fib-slice AMM granularity in the multi-strand payment loop
19:03 UTC	xrpl-validator	`f0f311e`	feat(ledger): DX_PAY round line before the loop's breaks
19:03 UTC	xrpl-validator	`0144f50`	fix(ffi): route the registry journal to the capturing sink so Payments trace
19:03 UTC	xrpl-validator	`9426fbe`	fix(ledger): price an out-limited fill through the offer's encoded quality
19:03 UTC	xrpl-validator	`01c41a0`	fix(ledger): a single-path leg is priced by its pool's SPOT quality
19:03 UTC	xrpl-validator	`40cabb2`	feat(ledger): DX_HEADS/DX_RAWHEADS — per-leg book heads in the bridged walk
19:03 UTC	xrpl-validator	`37d5625`	fix(ledger): the stream's dead tests apply to the taker's own offer too
19:03 UTC	xrpl-validator	`edf469a`	fix(ledger): a bridged leg's pool prices the strand only while two are active
19:03 UTC	xrpl-validator	`b18410f`	fix(ledger): price an AMM bridge leg at the amount that actually flows

Merged	Repo	Commit	Subject
19:03 UTC	xrpl-validator	`8152aca`	fix(ledger): one AMM turn per pass, and a rejected pass ends the crossing
19:03 UTC	xrpl-validator	`133fd89`	fix(ledger): judge a fill's achieved quality exactly, as rippled does
19:03 UTC	xrpl-validator	`d6f7589`	fix(ledger): round a fill's XRP input by which side bounds it
19:03 UTC	xrpl-validator	`8b5a197`	feat(ffi): capture libxrpl's decision trace under XRPL_FFI_TRACE
19:03 UTC	xrpl-validator	`9ac6bcc`	feat(ledger): reverse pass — size each payment hop to what the next needs
19:03 UTC	xrpl-validator	`6e631e7`	fix(ledger): the POOL can activate a strand, and an active strand reaps
19:03 UTC	xrpl-validator	`99f8a7a`	feat(ledger): flow the default path alongside Paths, per pass
19:03 UTC	xrpl-validator	`c858f1f`	refactor(ledger): one strand code path in Payment
19:03 UTC	xrpl-validator	`a533219`	feat(ledger): AMMDeposit tfTwoAsset equalDepositLimit + tecAMM_FAILED
19:03 UTC	xrpl-validator	`7efe2fd`	fix(ledger): measure a payment hop's carry, don't subtract a sentinel
19:03 UTC	xrpl-validator	`b733ae7`	fix(ledger): remove self-crossed offers off the book tip
19:03 UTC	xrpl-validator	`be244f0`	fix(ledger): CredentialCreate joins both owner directories
19:03 UTC	xrpl-validator	`4bac28e`	fix(ledger): apply tfSetfAuth to the trust line
19:03 UTC	xrpl-validator	`d5a08c8`	fix(ledger): align IOU addition the way STAmount does
19:03 UTC	xrpl-validator	`549abb1`	fix(probe): hydrate trust lines for the currencies named in Paths
19:03 UTC	xrpl-validator	`9a82325`	fix(ledger): split a full NFToken page before inserting
19:03 UTC	xrpl-validator	`761df02`	fix(ledger): consolidate NFToken pages when a removal shrinks one
19:03 UTC	xrpl-validator	`e12436b`	fix(ledger): tfOneAssetWithdrawAll empties the LP position
19:03 UTC	xrpl-validator	`a0363a7`	Revert "fix(ledger): remove the taker's own offer even when nothing crosses"
19:03 UTC	xrpl-validator	`70ea97e`	fix(ledger): remove the taker's own offer even when nothing crosses
19:03 UTC	xrpl-validator	`a67eeca`	fix(ledger): enforce lsfRequireAuth on the receiving trust line
19:03 UTC	xrpl-validator	`aaf0c79`	fix(ledger): CredentialDelete needs only one of Subject/Issuer
19:03 UTC	xrpl-validator	`5582a93`	fix(ledger): funding outranks expiry in OfferCreate preclaim
19:03 UTC	xrpl-validator	`e10fe45`	fix(probe): hydrate the ISSUERS' owner directories for OfferCreate
19:03 UTC	xrpl-validator	`413368a`	fix(ledger): a bridge leg with a pool but no book carries nothing

Merged	Repo	Commit	Subject
19:03 UTC	xrpl-validator	`95eb59c`	fix(ledger): pass the page hint when a payment tears down a trust line
19:03 UTC	xrpl-validator	`e7b7d4d`	fix(ledger): AMMWithdraw by LPTokenIn pays out both pool assets
19:03 UTC	xrpl-validator	`2488343`	feat(ledger): NFTokenMint carrying Amount also rests a sell offer
19:03 UTC	xrpl-validator	`d753d7a`	fix(ledger): OfferCreate reserve is pre-fee, and expiry precedes it
19:03 UTC	xrpl-validator	`52a567d`	fix(differential_probe): put the RPC server in the cache key
19:03 UTC	xrpl-validator	`11a9c6c`	fix(xrpl-ledger): an AMM deposit must fund its XRP side after reserve
19:03 UTC	xrpl-validator	`5704d68`	feat(xrpl-ledger): token escrow, and give escrows their directory entries
19:03 UTC	xrpl-validator	`cce3c8d`	fix(xrpl-ledger): cap a direct IOU payment at what the destination can receive
19:03 UTC	xrpl-validator	`edf4462`	fix(xrpl-ledger): finish CheckCreate's destination checks
19:03 UTC	xrpl-validator	`8b23677`	fix(xrpl-ledger): honour the NFT offer opt-out on Owner and Destination
19:03 UTC	xrpl-validator	`1c46cda`	fix(xrpl-ledger): a frozen holder can fund nothing
19:03 UTC	xrpl-validator	`625399c`	fix(xrpl-ledger): a bridged pass needs its book composition within the limit
19:03 UTC	xrpl-validator	`1edaa63`	fix(xrpl-ledger): tick re-derivation divides with the STAmount rule
19:03 UTC	xrpl-validator	`bb522bf`	fix(xrpl-ledger): a crossing that exhausts the account rests no remainder
19:03 UTC	xrpl-validator	`ba73d4f`	fix(xrpl-ledger): carry the trailing reap across book levels
19:03 UTC	xrpl-validator	`130c246`	fix(xrpl-ledger): step past a satisfied fill, and reap dust-backed offers
19:03 UTC	xrpl-validator	`51f6fef`	docs(xrpl-ledger): correct the stale directory.rs scope note
19:03 UTC	xrpl-validator	`01f09ba`	fix(xrpl-ledger): reap a book level's dead offers before consulting the pool
19:03 UTC	xrpl-validator	`f6ed033`	fix(clawback): decode the base58 holder from Amount.issuer
19:03 UTC	xrpl-validator	`881e160`	fix(nftoken): decode the base58 Issuer field on authorised-minter mints
19:03 UTC	xrpl-validator	`34a549a`	docs: honest README + PROGRESS — accurate architecture + status
19:03 UTC	xrpl-validator	`7eb0dca`	fix(differential_probe): hydrate the issuer's owner-dir tail for CheckCash
19:03 UTC	xrpl-validator	`a7bd6a0`	fix(xrpl-ledger): implement AMMWithdraw tfWithdrawAll teardown
19:03 UTC	xrpl-validator	`77f6f39`	fix(xrpl-ledger): honour tfPassive -- don't consume equal-quality makers
19:03 UTC	xrpl-validator	`7e592e9`	fix(xrpl-ledger): re-check a maker's actual quality, not just its book page

Merged	Repo	Commit	Subject
19:03 UTC	xrpl-validator	`84898d4`	fix(xrpl-ledger): cross an underfunded maker at book quality, don't rest
19:03 UTC	xrpl-validator	`04a1586`	fix(xrpl-ledger): cap payment delivery at the destination's trust limit
19:03 UTC	xrpl-validator	`34fca11`	fix(xrpl-ledger): honour keepRoot when a directory page empties
19:03 UTC	xrpl-validator	`b79f40f`	fix(xrpl-ledger): CheckCancel unlinks the Check from both owner directories
19:03 UTC	xrpl-validator	`1de6d87`	fix(xrpl-ledger): OfferCreate crossing spends only accountFunds, not TakerGets
19:03 UTC	xrpl-validator	`3a718aa`	fix(xrpl-ledger): a Payment to a pseudo-account is tecNO_PERMISSION
19:03 UTC	xrpl-validator	`609c827`	fix(xrpl-ledger): CheckCash requires exactly one of Amount / DeliverMin
19:03 UTC	xrpl-validator	`a823d98`	fix(xrpl-ledger): reject offers by achieved quality and skip expired ones; keep the cleanup on tecKILLED
19:03 UTC	xrpl-validator	`eb19a38`	feat(xrpl-ledger): DX_BOOK trace for the book walk's quality gate
19:03 UTC	xrpl-validator	`ce27e48`	fix(xrpl-ledger): tecOBJECT_NOT_FOUND for missing NFT offers, tecAMM_BALANCE for over-withdraw
19:03 UTC	xrpl-validator	`08515b3`	fix(xrpl-ledger): correct the credential keylet, allow self-issuance, hydrate it
19:03 UTC	xrpl-validator	`bfc83f9`	fix(xrpl-ledger): merging past an oracle's ten-entry cap is tecARRAY_TOO_LARGE
19:03 UTC	xrpl-validator	`3cebd6a`	fix(xrpl-ledger): AccountDelete fee is one owner reserve, read from the ledger
19:03 UTC	xrpl-validator	`2b1beae`	fix(xrpl-ledger): charge the issuer's TransferRate on payment delivery
19:03 UTC	xrpl-validator	`e27d088`	fix(xrpl-ledger): a payment cannot open the destination's trust line
19:03 UTC	xrpl-validator	`84ced29`	fix(xrpl-ledger): no AMM liquidity in permissioned-domain books — corpus 100%
19:03 UTC	xrpl-validator	`6b3b87b`	test(xrpl-node): repeatable corpus sweep + restore the #105761560 fixture
19:03 UTC	xrpl-validator	`4a36c48`	fix(xrpl-ledger): payments never autobridge — AMM over-mutation via a synthesized XRP leg
19:03 UTC	xrpl-validator	`a6ef95a`	fix(xrpl-ledger): direct IOU payment requires an existing destination trust line
19:03 UTC	xrpl-validator	`385e129`	fix(xrpl-ledger): AMMDeposit owner-reserve guard for zero-LPToken depositors
19:03 UTC	xrpl-validator	`bcf7e5c`	fix(xrpl-ledger): enforce owner reserve on object creation — TicketCreate + TrustSet
19:03 UTC	xrpl-validator	`0a4d4f5`	fix(xrpl-ledger): NFTokenCreateOffer token-existence preclaim + sandbox create-then-delete nets to nothing — 2 fresh-traffic finds
19:03 UTC	xrpl-validator	`c333d93`	feat(xrpl-ledger): per-leg AMM liquidity in bridged crossing — CORPUS 100% (1109/1109)
19:03 UTC	xrpl-validator	`f2d2bcb`	feat(xrpl-ledger): multi-path FIB AMM offers in bridged crossing — corpus stable 1107/1109
19:03 UTC	xrpl-validator	`020c568`	feat(xrpl-ledger): issuer account-hops, endpoint dedup, in-flight hygiene — all corpus payments match — corpus 99.8%

Merged	Repo	Commit	Subject
19:03 UTC	xrpl-validator	`96dcd62`	feat(xrpl-ledger): rippled QualityFunction limit-trim for AMM fills — corpus 99.5%
19:03 UTC	xrpl-validator	`7d51d97`	fix(xrpl-ledger): me_muldiv 16-digit quotient scaling; AMM fee-adjusted spot; AMM turn in bridged crossing — corpus 99.3%
19:03 UTC	xrpl-validator	`7111b1f`	feat(xrpl-ledger): XRP autobridging for IOU↔IOU crossing; sender-reserve funding check — corpus 99.2%
19:03 UTC	xrpl-validator	`a146364`	feat(xrpl-ledger): full AMM lifecycle parity — Create/Deposit/Withdraw on real legs — corpus 99.1%
19:03 UTC	xrpl-validator	`13197e6`	feat(xrpl-ledger): Number-exact rounding, XLS-80 domain books, multi-hop payment strands, real reserve — corpus 98.8%
19:03 UTC	xrpl-validator	`454d6c6`	feat(xrpl-ledger): real NFTokenPage model — mint/burn/accept/cancel/modify on structural page keys — corpus 98.2%
19:03 UTC	xrpl-validator	`d28de50`	feat(xrpl-ledger): real TicketCreate + OracleSet/OracleDelete transactors; tecDST_TAG_NEEDED — corpus 97.5%
19:03 UTC	xrpl-validator	`a585ce8`	feat(node): differential_probe RPC disk cache — immutable historical lookups, DX_CACHE override
19:03 UTC	xrpl-validator	`5b1d386`	fix(xrpl-ledger): faithful OfferCreate preclaim funding — tecUNFUNDED_OFFER — corpus 96.8%
19:03 UTC	xrpl-validator	`870eefd`	fix(xrpl-ledger): sell-side offer funding check — tecUNFUNDED_OFFER — corpus 96.8%
19:03 UTC	xrpl-validator	`3a3f337`	feat(xrpl-ledger): tfSell crossing semantics — sell the whole TakerGets — corpus 96.3%
19:03 UTC	xrpl-validator	`d547205`	fix(xrpl-ledger): trust-line lifecycle — receiver-only reserve, NoRipple, zero-balance deletion — corpus 95.6%
19:03 UTC	xrpl-validator	`bb1eefa`	fix(xrpl-ledger): route strand output to the destination — corpus 95.6%
19:03 UTC	xrpl-validator	`a5db381`	fix(xrpl-ledger): issuer TickSize in offer placement — corpus 95.0%
19:03 UTC	xrpl-validator	`18d4a00`	feat(xrpl-ledger): AMM swap engine — corpus 94.1%, the third summit
19:03 UTC	xrpl-validator	`28f0cb6`	fix(xrpl-ledger): path payments — quality gate only under tfLimitQuality, DeliverMin floor, book pre-state — corpus 90.3%
19:03 UTC	xrpl-validator	`02508d9`	feat(xrpl-ledger): CheckCash via transfer engine + tec classification — corpus 90%
19:03 UTC	xrpl-validator	`a4dc8d7`	feat(xrpl-ledger): CheckCash via shared transfer engine — IOU checks + tecPATH_PARTIAL semantics
19:03 UTC	xrpl-validator	`e6efe32`	feat(xrpl-ledger): IOU + cross-currency payment engine — second summit
19:03 UTC	xrpl-validator	`f5b87b2`	fix(xrpl-ledger): cancel-and-replace + funded-check starvation — OfferCreate 64%
19:03 UTC	xrpl-validator	`7ee6dcd`	feat(xrpl-ledger): integer offer-crossing engine — the summit assault
19:03 UTC	xrpl-validator	`150c432`	feat(xrpl-ledger): order-book quality keylet + OfferCreate placement — base camp
19:03 UTC	xrpl-validator	`ad0f628`	feat(xrpl-ledger): ticket consumption in apply_common — OfferCancel 19/19
19:03 UTC	xrpl-validator	`e93b4b3`	feat(xrpl-ledger): CheckCreate + NFTokenCreateOffer parity — 5 fully-green types
19:03 UTC	xrpl-validator	`270345a`	feat(xrpl-ledger): OfferCancel directory unlinking — 6/6 MATCH across two ledgers

Merged	Repo	Commit	Subject
19:03 UTC	xrpl-validator	`87d6ff7`	feat(xrpl-ledger): trust-line deletion + oracle state threading — TrustSet 14/14 MATCH
19:03 UTC	xrpl-validator	`a22af92`	feat: multi-page owner directory + load native-read keys — TrustSet 1->10 MATCH
19:03 UTC	xrpl-validator	`274d420`	feat(ledger): owner-directory bookkeeping (single root page) + wire into TrustSet
19:03 UTC	xrpl-validator	`51c9665`	revert NFToken offer-ref parse (needs focused pass); keep AMM XRP+base58 encoding fix
19:03 UTC	xrpl-validator	`31735dc`	fix(ledger): NFTokenAcceptOffer reads offer ref as hex ledger-index, not {Account,Sequence}
19:03 UTC	xrpl-validator	`330ed4d`	feat(node): differential_probe loads pre-state objects (not just AccountRoots)
19:03 UTC	xrpl-validator	`fdca115`	fix(ledger): TrustSet decodes base58 issuer (was hex-only → every real tx temMALFORMED)
19:03 UTC	xrpl-validator	`f70baf9`	test(node): 5 coverage fixtures (AMM/Check/NFToken-accept) for engine-wide conformance map
19:03 UTC	xrpl-validator	`9cfb9af`	fix(node): differential_probe --json emits only JSON (SUMMARY to stderr); re-mint sample fixtures with tx_json
19:03 UTC	xrpl-validator	`c862c37`	feat(node): differential_probe — measure native engine vs mainnet parity
19:03 UTC	xrpl-validator	`8ed5545`	feat(node): network-parameterized replay — NetParams for testnet/devnet parity probes
19:03 UTC	xrpl-validator	`3bac75a`	test(node): arm scout find #105663160 — NFTokenAcceptOffer silent-TER parity gate
19:03 UTC	xrpl-validator	`52e9df5`	feat(node): parity_probe bin — runtime fixture replay for the scout loop
19:03 UTC	xrpl-validator	`cdb0ffe`	loop(succ): run report 20260716-145704 — SUCCESS
19:03 UTC	xrpl-validator	`612d6be`	loop(succ): attempt 3 — RpcProvider::succ has no NFTokenPage awareness — rippled's page walk p
19:03 UTC	xrpl-validator	`64bef93`	loop(succ): attempt 2 — g1's two remaining mutation mismatches are pathed cross-currency Payme
19:03 UTC	xrpl-validator	`a344c2f`	loop(succ): attempt 1 — On the standalone-RPC path pre-state capture for Modified keys consult
19:03 UTC	xrpl-validator	`e34f42d`	test(node): backlog parity gates — 6 divergence-lead ledger fixtures + generator
19:03 UTC	xrpl-validator	`892a9dc`	merge succ-loop: RpcProvider/LayeredProvider succ() directory walk (approved via Telegram)
19:03 UTC	xrpl-validator	`e0c2976`	loop(succ): run report 20260716-114254 — SUCCESS
19:03 UTC	xrpl-validator	`dcc145c`	loop(succ): attempt 2 — g2's remaining divergences stem from cross-currency Payments (6+ in le
19:03 UTC	xrpl-validator	`7ea2bdc`	loop(succ): attempt 1 — s2.ripple.com is Clio, which rejects ledger_data markers that aren't e
19:03 UTC	xrpl-validator	`9206f5c`	loop(succ): run report 20260716-112329 — HARNESS_ERROR
19:03 UTC	xrpl-validator	`bff9f3b`	loop(succ): attempt 1 — RpcProvider/LayeredProvider succ can be implemented as a marker-seeded
19:03 UTC	xrpl-validator	`23a76a8`	fix(node): era-guard FFI verify + never keep unverifiable the validator's ledger feed writes

Merged	Repo	Commit	Subject
19:03 UTC	xrpl-validator	`5ea6c9e`	fix(node): hold the validator's ledger feed position on unapplied ledger instead of skipping
19:20 UTC	xrpl-validator	`2d66eb0`	feat(xrpl-node): Stage 4 Phase A — native-engine shadow leg (XRPL_NATIVE_SHADOW=1)
19:31 UTC	xrpl-validator	`02465de`	fix(xrpl-node): shadow leg stamps threading — first-light lesson
19:53 UTC	xrpl-validator	`fcb7b3a`	feat(xrpl-node): shadow receipts name their classes — typed missing keys, stale-mirror audits, reconcile-leak verifier
21:35 UTC	xrpl-validator	`032f9c3`	fix(xrpl-ledger): funds-exhausting fill sizes from the gross-cap chain, not the rem_gets accumulator
21:35 UTC	xrpl-validator	`c53b5af`	fix(xrpl-ledger): funds-exhausting fill sizes from the gross-cap chain, not the rem_gets accumulator
22:59 UTC	xrpl-validator	`bf4a729`	fix(xrpl-ledger): equal-withdraw fraction ceils, asset products floor
23:34 UTC	xrpl-validator	`0ac8d7e`	fix(xrpl-ledger): AMMVote — default-zero omission and AuctionSlot DiscountedFee
23:35 UTC	xrpl-validator	`d57e19b`	feat(xrpl-node): shadow dumps the engine's-eye tx on first per-ledger TER mismatch
00:53 UTC	xrpl-validator	`c26156a`	fix(xrpl-ledger): equal-withdraw fraction ceil gates on fixAMMv1_3
02:03 UTC	xrpl-validator	`4185a4a`	fix(xrpl-ledger): equal-withdraw fraction gates on WITHDRAW MODE, not amendment
03:08 UTC	xrpl-validator	`02e0bbb`	fix(xrpl-node): mirror speaks the engine's dialect — hexify addresses on every decode
03:20 UTC	xrpl-validator	`9badf09`	fix(xrpl-node): shadow hydration — clear-before-fill and live-edge gating

Findings fixed

No engine findings merged into main this day.

Other engineering changes

- **feat(xrpl-node): XRPL_REPLAY_TIMING=1 — per-ledger apply/hash phase receipts** (`c9dc9c2`, xrpl-validator) The Stage 4 perf gate: raw native-apply cost with no RPC in the path, on its own TIMING line so gate greps of REPLAY lines stay stable. Verdict over 280 ledgers / 29,464 txs: apply avg 20.6ms, median 19.9ms, p95 37.6ms, max 63.9ms — 62x headroom at worst against the 4s ledger cadence. The 11.6s avg encode+fold is the replay's own full re-fold of 14M entries, not the engine (the live validator hashes incrementally in …
- **fix(xrpl-ledger): NFT transfer-fee royalty rounds half-even, not floor** (`84b245c`, xrpl-validator) rippled computes the royalty as multiply(amount, transferFeeAsRate(fee)) (NFTokenAcceptOffer.cpp:420/:540); asAmount(rate) is non-native so the native fast path never applies and the Number pipeline runs: ONE half-even reduction of the FULL product to 16 significant digits (multiply folds the whole remainder into the tie), /100000 as pure exponent arithmetic, then half-even again at the integer-drop boundary. We …
- **fix(xrpl-node): probe fallback triggers on 'internal' — rippled masks lgrNotFound for non-admin** (`dffa32c`, xrpl-validator) the reference node answers the same account_info@pre-window ledger 'lgrNotFound' to an admin curl and 'internal' to the validator host; public s2 answers 'internal' where Clio-backed xrplcluster serves the data. The lgrNotFound-only trigger meant the fallback NEVER fired from the gates — the entire 18-

fixture 'deterministic' hist residue was hydration that never got a chance (ours tecNO_DST vs net tecNO_PERMISSION with the dst account provably …

- **feat(xrpl-ledger): BookStep requireAuth — unauth owners reaped, unauth pools yield no synthetic** (`46f139b`, xrpl-validator) rippled runs requireAuth(book.in, owner) per offer in the stream (BookStep.cpp:755): under the issuer's lsfRequireAuth the OWNER — an AMM pool account included — must hold the ISSUER-side auth flag (issuer low ? lsfLowAuth : lsfHighAuth, the 0x40000/0x80000 line bits) on its line for the asset flowing INTO it; a missing line is tecNO_LINE, and there is NO balance grandfather (that mercy is only DirectStep.cpp:430's …
- **fix(xrpl-node): probe s2 fallback retries transient failures** (`24c2d93`, xrpl-validator) Single-attempt fallback silently kept the primary's lgrNotFound whenever s2 dropped the call (fleet contention: 2428 permanently-uncacheable misses on l106281182, phantom 52/57). Retry 3x like the primary, treat slowDown-class JSON errors as transient, settle on success or a deterministic negative. lgrNotFound from the full-history server itself is settled. DX_RPCLOG gains a FALLBACK-> outcome receipt.
- **fix(xrpl-ledger): AMMVote applyVote ported for real — wrapped VoteEntry, VoteWeight from live LP balances, lowest-weight eviction, weighted-average TradingFee** (`1478907`, xrpl-validator) The stub wrote flat weightless entries; the codec rightly refused to encode them and every fresh-window replay died at the first AMMVote (#106589344, ENCODE-ERR then cascade). First specimen verified by the fresh-window replay sailing through the vote ledger: 66 clean until the next (unrelated) frontier.
- **fix(xrpl-ledger): a tfSell crossing's stream trails the whole in-limit book — trial past live offers, reap the dead — and probe book hydration seeds at the book base** (`e6f0192`, xrpl-validator) rippled sizes tfSell with an unbounded-out sentinel: the rev stream trial-consumes every in-limit live offer and keeps stepping, permRm'ing dead offers it lands on; only a beyond-limit live offer ends the walk. Four exit sites taught the rule. Probe-side: book_offers hides expired tips like unfunded ones — seed the ledger_data walk at base24+zeros (the 'marker must exist' constraint is false on 3.3.0). New receipts: …
- **fix(xrpl-ledger): a missing escrow is tecNO_TARGET, not tecNO_ENTRY — EscrowFinish and EscrowCancel, all four sites** (`42616e0`, xrpl-validator)
- **fix(xrpl-ledger): AMM pool admission is context-dependent — fib-slice average under multiPath, raw spot single-path, keyed on iteration-entry multiPath — two hundred eighty consecutive ledgers** (`f28a6eb`, xrpl-validator)
- **fix(xrpl-ledger): AccountSet asf-to-lsf is a table, not a shift — two hundred fifty-eight consecutive ledgers** (`527956b`, xrpl-validator) #106455275 56049FD1 (SetFlag 13, asfDisallowIncomingCheck): mainnet stamps lsfDisallowIncomingCheck 0x08000000; our AccountSet wrote `1 << 13` = 0x2000. The asf numbers are enum ordinals, not bit positions — the mapping is a table (LedgerFormats.h:128-142, TxFlags :408-425, ported verbatim): asf 1-4, 6-9 and 12-17 map to their lsf bits; asf 5 manages AccountTxnID FIELD PRESENCE (apply_common already rewrites it per …
- **fix(xrpl-ledger): the strand ub composes hop-0 trIn and the final DirectI's issuing rate — two hundred forty consecutive ledgers** (`af8bd2f`, xrpl-validator) #106455274 13296833 (24.29 USDT -> 5.92M PEPE, six strands): our strand upper bounds ran x1.001^2 too good, so strands 1 and 5 slipped past limitQuality 4.10227e-6 where rippled refuses them — turning rippled's single-admitted-strand, multiPath-false, one-anchored- iteration fill into three fib-sliced rounds with different intermediate fills. The two missing factors: (a) hop-0 trIn: the FIRST book step's prev is the …

- **fix(xrpl-ledger): the fwd chain carries the PRODUCED amount when the delta is exact, and a met-want hop flushes its excess input through the pool — two hundred thirty-nine consecutive ledgers** (`390bff3`, xrpl-validator) #106455266 CF7BAB85 (XRP -> OAR -> PLX, two pools, circular): pool 1's out rounds UP (29.71809727 OAR against the rev want ...26921203) and rippled's fwd hands the WHOLE product to book 2 — its pool receives the full figure, pays the curve's crumbs (70.7902709126 PLX), the dst is credited the Amount exactly and the ISSUER nets the 1.86e-9 difference. Two ports: (a) The hop carry prefers the measured delta over the …
- **fix(xrpl-ledger): strand admission is judged once per iteration — an un-attempted self-removal resets the level anchor — TWO HUNDRED TWENTY CONSECUTIVE LEDGERS, THE WHOLE FETCHED RANGE** (`d94dc7f`, xrpl-validator) #106455252 3F75D634 (the counter-counter-specimen: two taker-owned offers on CONSECUTIVE levels, 1.86775e-11 and 1.86899e-11, both inside the inflated limit 1.870171055e-11): rippled removes BOTH inside flow iteration 0. The mechanism is the ofrQ reset — a self-removal with no offer yet attempted nulls the stream's level anchor ("if (!offerAttempted) ofrQ = std::nullopt", BookStep.cpp:441-448) — so the level-change …
- **fix(xrpl-ledger): the crossing walk's remainingOut is StrandFlow's fold, never a running subtraction — two hundred seventeen consecutive ledgers** (`cbfc29a`, xrpl-validator) #106455246 5BEBD5DB (7186 XRP buying 10514 RLUSD across forty quality levels): flowCross runs through flow() — one quality level (or one AMM slice) per iteration, the stream's level-change check breaking each pass (BookStep.cpp:720-724) — and every iteration re-derives remainingOut as outReq − the sorted-ascending 16-digit fold of savedOuts (StrandFlow.h:639-642). Our walk carried rem_pays at full width across all …
- **fix(xrpl-ledger): trustCreate NoRipple — creator side from the tx flags ONLY, peer side stamped when the PEER lacks DefaultRipple — two hundred eleven consecutive ledgers** (`7ec3a7c`, xrpl-validator) #106455241 BD3CFFCF (a bot TrustSet with Flags=0 creating an XRPHAI line): our create arm defaulted the CREATOR's NoRipple from the CREATOR's own missing lsfDefaultRipple and never touched the peer side. rippled's trustCreate (RippleStateHelpers.cpp:258-283) does the opposite on both counts: the account-being-set gets NoRipple only from `bSetNoRipple && !bClearNoRipple`, and the PEER's side is stamped when the PEER …
- **fix(xrpl-ledger): the underfunded crossing clamp threads the balance as the walk's GROSS cap — two hundred six consecutive ledgers** (`5485685`, xrpl-validator) #106455229 7D1380A7 (IoC tfSell selling its whole 1.58026353300976e-5 BTC line through the XRP/BTC pool): the underfunded clamp computes tg_cross = avail/rate and hands the walk a NET budget with no gross cap, so the exhausting AMM slice re-grosses net x rate and overdrains the line by one ulp past zero (+1e-20 where mainnet writes canonical zero). rippled's clamped sendMax IS the crossing's remaining-in, and an …
- **fix(xrpl-ledger): crossing removes self-offers past the strict threshold — but only in an ADMITTED strand — one hundred ninety-four consecutive ledgers** (`5d46894`, xrpl-validator) Two coupled rippled rules, pinned by opposite-outcome specimens on the SAME book three ledgers apart: (a) The crossing stream steps PAST the strict threshold: `limitSelfCrossQuality` runs BEFORE `checkQualityThreshold` (BookStep.cpp:729/770), both gating on qualityThreshold_ — the TRUE transfer-rate-inflated limitQuality — and "Remove this offer even if no crossing occurs" (:441-443). A failed flow keeps its …
- **fix(xrpl-ledger): the delivered figure is rippled's actualOut — the sorted 16-digit fold, never an exact-width sum — one hundred ninety consecutive ledgers** (`8bef73f`, xrpl-validator) #106455221 34F37CD0 (no-partial XRP→CNY→XLM, two strands, four alternating iterations): every round matched rippled, the remainder chain hit zero — and the !partial judge still said tecPATH_PARTIAL, because the delivered pot accumulated at FULL

width: the exact chain lands 80.905362410300298, 2e-15 short of the 80.9053624103003 Amount (round 2 an ulp low, round 3 the 16-digit remainder that cannot carry sub-ulp). …

- **fix(xrpl-ledger): tearing down a redeemed LP line charges ONLY the holder — one hundred eighty-six consecutive ledgers** (`c88dc80`, xrpl-validator) #106455156 713DEF80 (full LP redemption, tfLPToken withdraw): mainnet threads the pool's AccountRoot untouched at OwnerCount 1 and takes the holder 80 → 79; tear_down_lp_line decremented BOTH sides and wrote the pool's root to 0. The pool is the LP token's ISSUER and never pays reserve on those lines — rippled's deleteAMMTrustLine adjusts the non-AMM side alone, the trustCreate charge-the-creator rule seen from the …
- **fix(xrpl-ledger): a partial fib slice prices at the slice's CEIL-16 encoded quality — one hundred twenty consecutive ledgers, the range is clear** (`9885998`, xrpl-validator) #106455151 52F632B8 (PHNIX→XRP→FUZZY bridge, multipath fib, five iterations): our partial takes of the pool's synthetic offers priced at the RAW s_in/s_out ratio (iters 3-4 came out 2 and 3 ulps light, 5e-9 of PHNIX total, the sender's line remainder the only visible key). rippled prices a partial like any offer — through the ENCODED quality — and the receipts prove it never re-curves (no SWAPOUT for the partial).
- **fix(xrpl-ledger): every spend-side net division is mulRatio-NEAREST — the live-line clamp was the fourth and last floor — one hundred sixteen consecutive ledgers** (`737f067`, xrpl-validator) #106455142 C0442CB5 (default-path UNI→XRP drain, SendMax at the 1.001 issuer): the sender's whole 2.500399999999944 UNI line nets to quotient …041|958 — rippled's implied first DirectStep says …042 (nearest); our fund-limit clamp against the LIVE line balance still floored to …041, shaved the walk's budget one ulp under, and the maker offer 5622E947's residual (wants0 − net) read …959 for mainnet's …958. Both UNI …
- **fix(xrpl-ledger): a book strand's sin is GROSS — the round loop drained the NET pot with it — one hundred seven consecutive ledgers** (`afb53c1`, xrpl-validator) #106455119 EFFA952F (default-path FLR→XRP, SendMax 4018 FLR at the 1.003 issuer, partial): the strand-level spent chooser (1f31546) deliberately trusts the balance DELTA on a fee-bearing spend leg — and the line loses net + fee, so a book strand's sin comes back GROSS (round 0: 1339.4425643283, rippled's stpIn verbatim). The dispatch still classified it in_gross=false, so the update block: - subtracted the GROSS …
- **fix(xrpl-ledger): direct and run-tail asks take the NET twin verbatim — dividing the gross pot cannot recover it — eighty-four consecutive ledgers** (`b14b09a`, xrpl-validator) #106455116 F04EF64E (rapido5, XRP→RLUSD→EUR.rhub8 →run→ EUR.rvYAfW, DeliverMin): the mixed strand's tail run was asked for net_rem_out = want_gross / want_rate — and that division can NEVER recover the Amount: want_gross was rounded UP past Amount × rate (mulRatio, a12ffd5's own fix), so the quotient sits ABOVE the Amount (… 2710/1.0015 = 2588523229458522.2) and any rounding lands high. The run then planned and …
- **fix(xrpl-ledger): merge_pages sorts by compare_tokens, not whole-ID hex — eighty-one consecutive ledgers** (`3b38011`, xrpl-validator) #106455111 D9C28F93 (NFTokenAcceptOffer): the transfer consolidates the buyer's page chain (two pages modified, one deleted, survivor at exactly 32 tokens). rippled's merge concatenates two adjacent pages — each already a compareTokens-ordered run, low 96 BITS first, whole ID only as the tiebreak — and never re-sorts. Our merge_pages re-sorted the union by the whole-NFTokenID hex string, reordering across the seam …
- **fix(xrpl-ledger): the hop-joint net division is mulRatio-NEAREST, not floor — seventy-six consecutive ledgers** (`e4c1581`, xrpl-validator) The morning's deferred F1 site, now specimen-pinned. rippled nets an in-limited carry through a gateway rate at mulRatio-nearest (DirectStepI fwd srcToDst = mulRatio(in, QUALITY_ONE, srcQOut, false); the LIMITSTEPIN receipts show the same division inside BookStep: stpIn = the gross cap verbatim, ofrIn = the net by division). Our hop joint floored.

- **fix(xrpl-ledger): gross_in is mulRatio and in-limited fills are GROSS-PRIMARY — the coupled spend-side campaign, seventy-five consecutive ledgers** (`a12ffd5`, xrpl-validator) The campaign the gross_in note parked ("one campaign, not piecemeal") — both halves receipt-pinned, and the A/B proved neither works alone: 1. gross_in: exact ceil → rippled mulRatio (BookStep.cpp:770 stpIn = mulRatio(ofrIn, trIn, QUALITY_ONE, roundUp) — nearest-16 + bump on a pre-normalize remainder). #106455107 7844199C: net 0.01536809504818859 × 1.003 = …315|577 → nearest …316 → bump …317 (mainnet's spend-line …
- **fix(xrpl-ledger): a zero hop-carry delta with nonzero walk-accounting is a BLIND delta, not a dry hop — the self-fill face** (`d882679`, xrpl-validator) #106455105 1232F8E8 / #106455106 E71A9888 (one bot, RLUSD→BTC→XRP, DeliverMin, tfPartialPayment): mainnet fills 16 RLUSD → 0.000203 BTC → 10879958 drops, lands under DeliverMin 10913307, and rolls back the flow as tecPATH_PARTIAL (fee-only). We answered tecPATH_DRY.
- **feat(xrpl-ledger): limitOut quality-function trim, net-units judge, and per-iteration NET destination credits — seventy-two consecutive ledgers** (`677f310`, xrpl-validator) The tfLimitQuality campaign, closing scout-find 106453302 (the extra-reap class) and stretching the replay streak 67 → 72. Three mechanisms, one specimen: BFC61DEF (16 RLUSD-family arb, XRP→USDC→USDT→ETH, limit set).
- **fix(xrpl-ledger): payment remainders from savedOuts totals; want_gross via mulRatio; fee trim reuses the rev cache — sixty-seven consecutive ledgers** (`dae7e88`, xrpl-validator) Three coupled one-ulp rules, all invisible to key-level MATCH — the census and the replay byte-diff are the legs that see them: 1. TOTALS, NOT RUNNING REMAINDERS. StrandFlow keeps every winning pass in a sorted multiset and re-derives remainingOut = outReq − sum(savedOuts) and remainingIn = sendMax − sum(savedIns) every iteration (StrandFlow.h:639-642, 762-766; sum folds ascending, one half-even 16-digit add per …
- **fix(xrpl-ledger): tfSell residual gets rounds half-even, not truncated — fifty-four consecutive ledgers** (`4cffac5`, xrpl-validator) rippled's afterCross.in for a tfSell remainder is an STAmount SUBTRACTION (takerGets minus the crossed in), and Number normalizes the result to 16 digits at to-nearest. Our residual took norm16 — a truncation.
- **fix(xrpl-ledger): tecKILLED discards the OfferSequence cancel — fifty-three consecutive ledgers** (`808c980`, xrpl-validator) OfferCreate is not a standard tec-rollback transactor: doApply keeps TWO sandboxes and picks by applyGuts' second return — sb (everything) or sbCancel (fee + the unfunded/expired reaps flowCross mirrors into both, OfferCreate.cpp:463-465, 969-989). Every return says {_, true} EXCEPT the two tecKILLED and one tefINTERNAL — and the OfferSequence cancellation is written to sb ONLY (:647). A killed IoC/FoK therefore …
- **fix(xrpl-ledger): fwd hops reuse rev-stamped debt directions — fifty consecutive ledgers** (`84a026e`, xrpl-validator) rippled's DirectStepI::debtDirection returns the CACHE in the forward direction (DirectStep.cpp:492-499) — the direction stamped during the rev pass, when no funds had moved. Our run_fwd re-probed src_redeems from the live sandbox, so a hop that DRAINED its line flipped the next hop's view of it from Redeems to Issues mid-pass, and the redeem-charge vanished.
- **fix(xrpl-ledger): a book redeems into the run behind it — forty-six consecutive ledgers** (`090b551`, xrpl-validator) A mixed strand's run saw only its own hops when deciding whether hop 0's issuer charges its transfer rate: qualitiesSrcIssues charges srcQOut exactly when the PREVIOUS STEP redeems, and hop 0 assumed strand-head (prev defaults to Issues). But a BOOK before the run reports DebtDirection::Redeems whenever ownerPaysTransferFee is off (BookStep.cpp:146), and OwnerPaysFee is a dormant amendment — on mainnet a book ALWAYS …

- **fix(xrpl-ledger): settle the taker once per quality level, not per fill — forty-four consecutive ledgers** (`84e17e0`, xrpl-validator) rippled's flow settles the TAKER once per iteration: the fwd pass's DirectStep debits result.in — accumulated with per-offer STAmount adds — and only the MAKERS are settled per offer (consumeOffer's two sends, BookStep.cpp:900-915). An iteration is ONE quality level (or one AMM slice standing in at a level head): BookStep stops at the level edge so the pass's marginal quality is well-defined, and flow() re-enters. …
- **fix(xrpl-ledger): tec rolls back the AccountTxnID stamp; delivery trim rounds nearest — forty consecutive ledgers** (`36feb4f`, xrpl-validator) #106455035-74 now replay byte-for-byte (~5,600 txs).
- **fix(xrpl-ledger): mulRatio requirements + blind-measurement guards — seventeen consecutive ledgers** (`fb798b3`, xrpl-validator) The replay now reproduces #106455035-51 byte-for-byte (~2,750 txs), and the mulRatio campaign lands whole: histsweep 426/426 INCLUDING the l106267220 specimen the first attempt regressed.
- **fix(xrpl-ledger): fresh multi-path verdict before the AMM turn — nine consecutive ledgers** (`f37bf9d`, xrpl-validator) The replay now reproduces #106455035-43 byte-for-byte (1,648 txs).
- **fix(xrpl-ledger): single-path re-arbitration in the bridge controller — seven consecutive ledgers** (`436102d`, xrpl-validator) The replay now reproduces #106455035-41 byte-for-byte (1,199 txs). Three rules from #106455041-42's maker-bot cluster: - offer: the bridged controller's direct-pair AMM turn now honors the per-round strand arbitration rippled does every driver iteration (activateNext drops strands whose upper bound misses limitQuality, then setMultiPath(activeStrands.size() > 1) — StrandFlow.h:672-674). A SINGLE-path round stops …
- **fix(xrpl-ledger): four fill-precision fixes — six consecutive ledgers byte-for-byte** (`b7831e7`, xrpl-validator) The full-ledger replay now reproduces #106455035-40 exactly (1,019 txs, root == account_hash). Four rules, each ~1 ulp or one nibble, all invisible to key-level gates: - payment: the post-round spend-side fee settlement is REMOVED — every walk fill already debits the sender the GROSS (CLOB move_leg_gross, AMM consume/consume_fib in_gross_rate, DirectHop rates), so the settlement charged the transfer rate a SECOND …
- **fix(xrpl-ledger): tfSell residual rests the subtracted in-side, repriced out** (`26b2e2d`, xrpl-validator) OfferCreate.cpp:491-521: after crossing, a tfSell offer's remainder keeps afterCross.in = TakerGets minus the crossed NET (a 16-digit STAmount subtraction), and REPRICES the out side — divRoundStrict(afterCross.in, rate, out.asset, roundUp=false), whole-drop floor on an XRP leg. Our placement derived the GETS side from rem_pays for both modes (right for buys — E7399DA3 — backwards for sells).
- **fix(xrpl-ledger): six mainnet-parity fixes from full-ledger replay rounds 2-3** (`e84d0b3`, xrpl-validator) Replaying #106455035-37 against account_hash (state_replay) surfaced six engine gaps the fixture corpus never reached; with all six the streak is three consecutive ledgers byte-for-byte (518 txs): - payment: a LEADING issuer-only path element (type 32) seeds from the spend currency — toStrand's normalization walks src → SendMax issuer first and the pairwise emission builds the same-currency cross-issuer book. …
- **feat(node): state_replay — full-ledger native replay vs mainnet account_hash** (`83858f9`, xrpl-validator) Phase 4 capstone. Loads the entire 19,376,944-object verified snapshot, decodes every blob through the canonical codec (the load doubles as a full-state codec census: decode → canon → encode must reproduce every blob — 0 mismatches after the xrpl-core amount fixes), hexifies to the engine's account convention, applies the next ledger's tx set through the native engine with NO truth-overlay and NO hydration, stamps …
- **feat(xrpl-node): state_verify — snapshot-dir account_hash verification** (`05de843`, xrpl-validator) Phase 4 substrate check: reads snapshot.py's harvested batches ({index, data} hex pairs), builds the State SHAMap with

the canonical leaf formula (SHA512Half(MLN\0 || data || key) — verify_rocks' and the live validator's), and compares the computed root against the pinned ledger's account_hash. Proves snapshot + SHAMap + hashing end-to-end before anything replays on top.

- **fix(xrpl-ledger): self-cross deletions roll back with a failed strand — dead reaps stay banked** (`9475a92` , xrpl-validator) Scan 4's single find, l106453801: a mirrored mis-attribution. 2D468DC2's REJECTED bridge candidate had walked leg A and self-cross-deleted the taker's own resting offer A20C602E (plus its book page); our rollback re-applied every reap from the failed candidate, so the deletion landed in 2D468DC2's meta (8v6 extra) — while mainnet still holds the offer until EA6D14A1 places on that very book ten txs later and …
- **feat(xrpl-ledger): pseudo-transactions + flag-ledger NegativeUNL rotation — phase 4 opens** (`1083ba5` , xrpl-validator) UNLModify / SetFee / EnableAmendment (Change.cpp), the consensus-injected transactions with no Account, no Fee, no Sequence. dispatch::is_pseudo routes them past preclaim/apply_common entirely; build_txfields accepts the zero account. New keylets: amendments (dedup'd — one already existed), negativeUNL. The NegativeUNL/Amendments singletons hydrate on every fixture alongside FeeSettings.
- **feat(xrpl-ledger): byte backlog to ZERO — 98→0, ten fixtures byte-exact** (`1733d67` , xrpl-validator) Three grind rounds against the byte census, every fix a canonical-shape rule the meta-level gates could never see: ROUND 1 (98→40): directory zero-link pollution — relinks wrote explicit 'IndexNext: 0' onto hydrated pages and every fresh page carried both zero links; fresh pages now omit them (set_link). Fresh BOOK pages gain their canonical fields (ExchangeRate = the root key's low 8 bytes + TakerPays/Gets …
- **feat(xrpl-node): BYTE CENSUS — canonical-codec serialization vs ledger_entry binary=true** (`a0b42aa` , xrpl-validator) Byte-for-byte phase 3, the instrument: DX_BYTECHECK=1 serializes every surviving touched node through the SDK's canonical STObject codec (xrpl_core::codec::encode_transaction_json — its definitions table covers ledger fields, LedgerEntryType string resolution, Vector256, inner arrays/objects) and byte-compares against the real post-state blob from ledger_entry binary=true. Reports first-diff offset with hex context, …
- **feat(xrpl-ledger): XChain — all eight XLS-38 transactors; STUB_TYPES is EMPTY** (`6036cee` , xrpl-validator) The last eight stubs. ZERO mainnet usage exists (no Bridge object on mainnet, no XChain tx in any fixture window), so the only reachable branch today is 'no bridge' (tecNO_ENTRY) — everything deeper executes only after a XChainCreateBridge lands, which the scout would surface with a fixture. Blind source ports from XChainBridge.cpp (2390 lines, all eight transactors in one file): - keylets: bridge = …
- **feat(xrpl-ledger): DID, PermissionedDomain, AMMClawback — five more stubs retired** (`75b2517` , xrpl-validator) Zero mainnet specimens exist for any of these in every fixture window, so these are BLIND SOURCE PORTS — flagged as such in-code; the scout becomes the verifier the day one lands. A faithful port can silently match; a fee-only stub is GUARANTEED to diverge.
- **feat(xrpl-ledger): MPT issuance lifecycle — Create/Destroy/Set/Authorize, stubs retired** (`64ebb07` , xrpl-validator) Byte-for-byte phase 2, first tranche: the four MPT lifecycle transactors leave STUB_TYPES and are judged like everything else.
- **feat(xrpl-ledger): threadOwners — created/deleted nodes thread their owner roots** (`48367bc` , xrpl-validator) Both census finds, one rule (ApplyStateTable.cpp:640-668): every CREATED or DELETED node threads the transaction to its owner accounts' AccountRoots — both limit issuers for a RippleState, else sfAccount and sfDestination when present, nothing for an AccountRoot. Those roots become the meta's pure-threading ModifiedNodes: the FinalFields==pre refreshes the expected-side filter has always dropped.
- **feat(xrpl-ledger): PreviousTxnID/PreviousTxnLgrSeq stamping + post-state threading census** (`9876271` , xrpl-validator) Byte-for-byte phase 1: the engine now THREADS. New ledger::threading — stamp_threading

marks every materially-changed write with the touching tx's hash and the ledger seq, under rippled's ApplyStateTable rule: a content-equal write-back (modulo pointer spelling and existing threading) is dropped from the meta and never threaded, so it is never stamped. 28 of 30 entry types carry the fields (fixPreviousTxnID added …

- **fix(xrpl-node): book hydration follows ledger_data markers — 400 pages, budgeted offers** (`64c8246`, xrpl-validator) #106433073 462DE605: a tfImmediateOrCancel selling 4845 drops for RLUSD. The maker's page sat 50 QUALITY LEVELS past the parent tip of the bot-deep RLUSD/XRP book; the trailing enumeration was one 24-row ledger_data call, so the walk saw clob=None and killed an IoC mainnet fills (tecKILLED vs tesSUCCESS, the maker offer well inside our own threshold).
- **feat(xrpl-ledger): last-LP withdrawal deletes the AMM — lines, object, pool account** (`aa37f6b`, xrpl-validator) #106430239 419A5D2C: tfWithdrawAll by the pool's ONLY LP. rippled's deleteAMMAccountIfEmpty fires once LPTokenBalance hits zero: every pool asset trust line is deleted UNCONDITIONALLY (deleteAMMTrustLine — the survive-at-zero rule is for ordinary withdrawals only), the AMM object leaves the pool's owner directory, and the pool AccountRoot is erased — the trace trustDeletes all three lines then threads to the …
- **fix(xrpl-ledger): payment-mode AMM fills pay the IN-side transfer rate GROSS** (`1e9a2e4`, xrpl-validator) #106426837 6BC6ACF9: circular XRP→FLR→XRPLOL arb through two pools, both tes but 11v8 — every fib fill 0.3% short (ours 1222.247 per slice vs mainnet's 1225.914; the arithmetic pins FLR's TransferRate 1.003 exactly). rippled's rdrIn: the previous step redeems, so the strand parts with ofrIn × rate while the pool receives the net — the trace's 9.931638943875375 = 9.901933144442048 × 1.003 to the digit. Our …
- **fix(xrpl-ledger): model ISSUER-ONLY path elements (type 32) as same-currency cross-issuer books** (`603a322`, xrpl-validator) #106425462 CF3FFF81: circular arb XRP→USD.rvYA→USD.rhub8→XAH.rswh whose path carries {issuer: rhub8, type: 32} between two account hops. rippled's toStrand keeps the running currency and emits a USD.rvYA→USD.rhub8 BOOK step (the trace shows it crossed: offer 576ED819 + two pools) — our path_legs required a currency on every element and dropped the whole path, answering tecPATH_DRY where mainnet delivers 16.328 XAH.
- **fix(xrpl-ledger): AMM offer generation reads pool balances ZERO-IF-FROZEN** (`29b5ccb`, xrpl-validator) Restock batch 2026-08-20 (24 fresh ledgers): 4 divergent, all ONE family — an arb bot's circular XRP->BITx->REGARD payments (F3BD86FA et al. across l106423982/l106427147/l106428943/l106428898, 24 txs) where mainnet says tecPATH_DRY and we delivered (or tecPATH_PARTIAL'd). The FFI trace names it in rippled's own words: 'AMMLiquidity::getOffer, frozen accounts' — fetchBalances reads through ammHolds(fhZERO_IF_FROZEN), …
- **feat(xrpl-ledger): anchored-slice bridged legs — single-path pool admission at SPOT, execution capped at the tip** (`4ee4288`, xrpl-validator) #106093637 BDB95F8A, the last parked OfferCreate. tfPassive sell of 1908.4258 RLUSD for 0.02948 BTC, autobridged. After the first pass consumes the 386EAFA9 leg-A head, mainnet's next iteration admits the strand at ub 64717.04 = leg-A tip 1.06832e-6 x leg-B pool SPOT 6.05785e10 (FLOWDBG receipt) and fills 12.03 RLUSD through the rURtT5MM clip offer plus the pool. Our bridged upper bound priced leg B at its FIB rate, …
- **feat(xrpl-ledger): MPT subsystem — direct MPT Payments and MPT Clawback** (`121869c`, xrpl-validator) 4F58CD19 (l106134471) and 3EC225FD (l106259185) both died in amount parsing: nothing recognized {mpt_issuance_id, value}. New tx::mpt module ports the MPTokensV1 subset: - keylets: mptIssuance = sha512h(0x007E || MPTID24), mptoken = sha512h(0x0074 || issuance_KEY || holder) — keyed by the issuance's

key, not its id. - Payment direct arm (Payment.cpp:516-590; V1 MPT never routes through flow): requireAuth both …

- **feat(xrpl-ledger): full PaymentChannel port — tfClose/tfRenew, expiry, keylet, hints** (`56832be`, xrpl-validator) A4E67EFD (l106124864): a pure tfClose claim (Flags only, no Balance) was temMALFORMED because do_apply demanded a Balance. Port the complete PaymentChannelClaim.cpp: expiry-close FIRST (any claimant closes an expired channel, before the permission gate), Balance arm (dst needs a channel authorization — tecNO_PERMISSION under fixCleanup3_2_0 — sig key must match the channel's, tecUNFUNDED_PAYMENT both directions, …
- **fix(xrpl-ledger): engine-placed offers carry BookDirectory/BookNode/OwnerNode hints** (`2b1fc05`, xrpl-validator) D63363BB (l106030993) + FAFBE1529 (l106065267): a bot places an offer and cancels it six txs later in the same ledger. Our placement wrote the Offer object WITHOUT its directory hints; OfferCancel reads BookDirectory off the object to unlink the book page, found None, and silently skipped the removal — the emptied page (CE26A7EB...:2) survived. Offers hydrated from mainnet carry the hints, which is why only …
- **fix(xrpl-ledger): four singles — CredentialAccept, SignerListSet, TrustSet, CheckCash** (`7965e2d`, xrpl-validator) CredentialAccept (CredentialAccept.cpp:122-123): expired credential is deleted (both dir unlinks, issuer OwnerCount-1) instead of accepted; on accept the reserve moves issuer->subject when they differ.
- **fix(xrpl-ledger): AMMWithdraw — LP line survives at zero unless default; issuer dir-tail hydration** (`6f72c88`, xrpl-validator)
- A plain withdraw burns LP tokens via redeemIOU — the ORDINARY line machinery — so trustDelete's default-state conditions apply: the LP-side limit must be zero and no quality settings present, else the zeroed LPToken line SURVIVES as Modified. (`deleteAMMTrustLine`, which deletes unconditionally, runs only when the AMM itself is deleted — Transactor.cpp:1050.) Our tear_down_lp_line's own comment stated the …
- **fix(xrpl-ledger): NFT accept — seller-owns-token NoPermission, IOU-priced settlement, strict page bound** (`527b389`, xrpl-validator) The whole NFTokenAcceptOffer cluster, three receipt-pinned rules: 1. "The seller must own the token" (NFTokenAcceptOffer.cpp:229; buy-arm :170): a stale offer whose owner no longer holds the NFToken is tecNO_PERMISSION — our transfer_token surfaced it later as tecNO_ENTRY. #106333939 2FEB03EC accepts a sell offer whose seller parted with 00081B58…0100. Checked in both direct and brokered arms.
- **perf(xrpl-node): cache deterministic negative RPC lookups; share the HTTP client** (`e302884`, xrpl-validator) A fully warm single-fixture probe measured 77s wall / 8s CPU — 90% network wait — because the cache stored only SUCCESSFUL lookups, so every negative answer (absent line, absent object: most of what the loaders probe) was a live round-trip to the reference node on every run, and every call built its own reqwest client (no connection reuse).
- **feat(xrpl-ledger): the flow driver — fib pace, zero-flow TER, consumed-trim stream, dead-level hydration** (`bb1ff88`, xrpl-validator) The whole remaining Payment class (6 both-tesSUCCESS + 3 TER, every multi-strand/pool payment on the board) closed by four receipt-pinned deltas against a skeleton that was already faithful. Design and all receipts in docs/FLOWDRIVER-DESIGN.md.
- **fix(xrpl-node): the probe recognizes threading-only ModifiedNodes that carry FinalFields** (`520fc6b`, xrpl-validator) rippled fills PreviousFields only when a field actually changed, so a ModifiedNode with FULL FinalFields and null PreviousFields is a pure threading refresh (PreviousTxnID/LgrSeq). trustDelete threads BOTH owners' roots: #106065267 F9E4D516 redeems EXP to its issuer, the zeroed line is deleted, and the

ISSUER's AccountRoot appears Modified with every field identical to the pre-tx state. The fixture format keeps …

- **fix(xrpl-ledger): tail admission is the residual-tip interval, not the anchored-slice quality** (`46a9986`, xrpl-validator) The anchored-at-limit slice test (8f34f5c) was the wrong quantity for the maxOffer branch: #106211626 D322E925 (BTC.Bitstamp→XRP) has no crossable tip, rippled's ub is spot × trIn = 1.58397e-11 ≤ limit 1.58531e-11 — admitted, limitOut-sized pool fill, realised exactly at the limit — and the slice test's trIn-grossed 1.5855e-11 vetoed it into a rest (4v7, plus the l106203258 OfferCancel cascade).
- **fix(xrpl-ledger): a tfSell keeps taking pool liquidity after the pays minimum is met** (`09be43a`, xrpl-validator) The AMM consume gates bailed on `me_is_zero(rem_pays)` — but for a tfSell the pays side is only a MINIMUM: once met it saturates to zero while the sell keeps spending rem_gets, and rippled's flow keeps taking pool liquidity for the remaining IN (its remainingOut is not the pays side for a sell).
- **fix(xrpl-ledger): bridge peeks reap dead offers they step over once the strand is running** (`0a25745`, xrpl-validator) Once a bridged crossing has EXECUTED a fill, the strand is definitely built and every subsequent stream-step removes the dead offers it passes — rippled reaps them even in an iteration whose liquidity then comes from the AMM. #106093637 1BE79D4A: iter 0 crosses the legB head (rD8VchnJ, funded exactly 0.59584264555 RLUSD), iter 1's stream steps over the EXPIRED rsqztuzpo (exp 839271795 ≤ parent close 839271841) and …
- **fix(xrpl-ledger): walk funding prices the reserve at the maker's first-peek OwnerCount** (`cf9f395`, xrpl-validator) During a flow, offer deletions are DEFERRED — rippled queues crossed offers as removable (OfferCreate.cpp:460) and stale ones in ofrsToRm (StrandFlow.h:694) — so within the walk an owner's OwnerCount, hence reserve, keeps its pre-walk value for every funding check. Our sandbox deletes inline, freeing one owner-reserve unit (200000) per deletion.
- **fix(xrpl-ledger): the offer stream keeps reaping past the limit once the strand was built** (`60f425d`, xrpl-validator) rippled's offer stream has no quality gate for STEPPING: once the strand was BUILT (tip or pool within the limit at some level), rev keeps stepping past DEAD offers on levels beyond the limit — reaping them — until a LIVE offer stops it (checkQualityThreshold ends the walk at execution, not at step). Our walk broke out at the first beyond-threshold level, leaving mainnet's reaps missing.
- **fix(xrpl-ledger): crossing tail AMM turn is gated by strand admission (anchored-at-limit ub × trIn)** (`8f34f5c`, xrpl-validator) BookOfferCrossingStep::qualityUpperBound for an AMM-bearing strand with no better CLOB tip is the quality of the slice anchored AT the limit (qualityThreshold_, the inflated limitQuality), GROSSED by trIn — the book step charges the IN issuer's rate on the taker's spend even though the pool sees net amounts. When that bound misses the limit, activateNext drops the strand and the pool never fills the tail.
- **fix(xrpl-ledger): a skipped self-offer stays the tail AMM anchor; the trOut judge compose was wrong** (`6f32591`, xrpl-validator) Two crossing rules, both pinned by FFI receipts and gated together (ammunb3: CORPUS 1461/1461 FRESH 3114/3114 NEW 5437/5437 BATCH2 2524/2524, census 0): 1. A self-offer SKIPPED without consumption stays the tip of rippled's book until an EXECUTING pass steps onto it — every later pass re-anchors tryAMM on ITS quality, even a pass that then goes dry. #106010546 7E746D30: the 11536 tip is the taker's own; iter 1 …
- **fix(xrpl-ledger): single-path crossing lets the AMM emit unbounded when the limit beats the LOB tip** (`8d8079d`, xrpl-validator) Two coupled rules from rippled's fixAMMv1_1 crossing path, pinned by FFI receipts (TRYAMM/ADMIT/STEPREV/STEPFWD probes on the vendored 3.2.1): 1. BookOfferCrossingStep::qualityThreshold (BookStep.cpp:475-481): in SINGLE-path crossing, when limitQuality

> the leg's LOB tip quality — a unit-blind Quality compare, so on bridge legs it contrasts cross-pair rates and drops-inflation decides — getAMMOffer(nullopt) emits …

- **fix(xrpl-ledger): offer crossing judges the pass with the OUT issuer's transfer rate composed** (`0d4ce0f`, xrpl-validator) BookOfferCrossingStep builds its CLOB quality function with WaiveTransferFee::No, so "Path rejected by limitQuality" fires on filed x trOut while qualityUpperBound (admission) deliberately waives the fee. Same rule in the walk's encoding: crossing_judge_threshold tightens the taker's threshold by rate(TakerPays issuer) for CLOB fills — AMM fills waive (OfferType::Amm), a bridge leg-B offer owned by the taker waives …
- **feat(xrpl-ledger): the default path of a cross-issuer same-currency payment is a direct strand** (`4771bdd`, xrpl-validator) toStrand builds the default strand src → [issuers] → dst for the shape `terminal_is_ripple_step` used to refuse wholesale, and lets the strand's own checks decide. Now we do too, gated to EXACTLY the classic-refused shape so nothing is modeled twice: #106065267 98C5B11E (1700 ZAR, src-issue → dst-issue, NO Paths) delivers over the one mutual line; #106336831's terNO_LINE refusal is preserved by the line check. The …
- **feat(xrpl-ledger): DirectStepI stage 2 — direct runs composed with book hops** (`87bffeb`, xrpl-validator) The mixed five flow: a Payment path mixing account elements with currency/issuer elements becomes segments [Run|Book] (mixed_layout — the same toStrand normalization, shared verbatim with the probe's hydration), sized right-to-left (books via size_book_hop, factored intact out of reverse_requirements; runs via run_rev) and flowed forward (books via cross_engine_to with the value riding IN FLIGHT through the sender; …
- **feat(xrpl-ledger): DirectStepI stage 1 — pure-account strands ripple for real** (`f13ad50`, xrpl-validator) docs/DIRECTSTEP-DESIGN.md stage 1: a Payment path made only of account elements becomes a strand of DirectStepI hops executed by a dedicated rev/fwd walker — the engine's first value delivered across mutual trust lines instead of books.
- **fix(xrpl-ledger): AccountDelete has no OwnerCount rule — the directory walk decides** (`976d6e3`, xrpl-validator) rippled's preclaim never looks at OwnerCount: the owner-directory walk answers tecHAS_OBLIGATIONS on any entry without a nonObligationDeleter, whatever the count says. Our count-first gate returned tecNO_PERMISSION before the walk ever ran — right refusal, wrong code, from a rule rippled never had. #106066467 248BF6E3.
- **fix(xrpl-ledger): AMMCreate preclaim — duplicate pool, reserve, funds, LP-token sides** (`24d983a`, xrpl-validator) AMMCreate::preclaim in rippled's order (AMMCreate.cpp:100-186); we checked nothing but account existence: 1. A pool for the pair already exists — tecDUPLICATE. #106118993 D98E76D5 recreates XRP/USD; we answered tecNO_PERMISSION from do_apply's own collision handling. The probe now asks ledger_entry amm for the pair (a fee-only meta never names the standing pool). 2. xrpLiquid(account, +1) <= 0 — the LPToken line's …
- **fix(xrpl-ledger): AMMWithdraw judges the DERIVED burn against the position, and the one-asset minimum** (`8c5e86b`, xrpl-validator) Two rules from the same file, cleared three specimens: 1. rippled's withdraw() core (AMMWithdraw.cpp:515-520) judges the ACTUAL burn against the LP's holding for EVERY mode — "failed to withdraw, invalid LP tokens". We judged only an explicit LPTokenIn; the amount-driven modes (tfTwoAsset, tfSingleAsset) derive their burn and sailed past. #106363879 55335BB9: 538.5 XRP derives 396924.53 LP against 369936.01 held — …
- **fix(xrpl-ledger): TrustSet destination rules — no new lines at pseudo-accounts or opted-out issuers** (`442c34c`, xrpl-validator) TrustSet.cpp:220-278, in rippled's order, both in preclaim before any reserve arithmetic: 1. lsfDisallowIncomingTrustline on the LimitAmount's issuer refuses a NEW line with tecNO_PERMISSION; fixDisallowIncomingV1 still allows adjusting an EXISTING one. 2. Pseudo-account

destinations: an AMM account accepts a new line only for its own LP token on a non-empty pool (wrong currency tecNO_PERMISSION, empty pool …

- **fix(xrpl-ledger): mint reserve gate must see the page insert too** (`d57f139`, xrpl-validator) rippled snapshots ownerCountBefore at NFTokenMint::doApply ENTRY (NFTokenMint.cpp:281-282) and the tail gate (:331-341) covers everything after it — its own comment: the reserve "is only managed when a new NFT page or sell offer is added". Ours snapshotted AFTER page_insert, so only the mint-offer arm was ever judged and a page-creating mint with no Amount slipped through unjudged.
- **fix(xrpl-ledger): an escrow whose deadline already passed is refused — and the token-escrow funds family** (`d86a69d`, xrpl-validator) Two coupled rules, either alone leaves the cluster divergent: 1. doApply's FIRST act (EscrowCreate.cpp:422-428): a CancelAfter or FinishAfter at-or-before the parent close time is tecNO_PERMISSION — after() is strictly `>` (View.cpp:559-562) and the harness header's close_time IS the parent's close. Outranks the XRP funding test and the tag test, both later in doApply. The 14-specimen burst (#106261496/582/583, …
- **fix(xrpl-ledger): OracleSet time rules — tecINVALID_UPDATE_TIME** (`d32160a`, xrpl-validator) OracleSet::preclaim (OracleSet.cpp:68-81, :128-130), all three sites in rippled's order, new TxResult::InvalidUpdateTime: 1. LastUpdateTime below the ripple epoch offset (946684800); 2. outside closeTime +/- kMaxLastUpdateTimeDelta (300s) — the harness header's close_time is the parent's close, "the last closed ledger"; rippled bails tecINTERNAL when closeTime < 300, unreachable on a real ledger, so a degenerate …
- **fix(xrpl-ledger): AMMVote refuses a voter who is not an LP** (`50d937e`, xrpl-validator) AMMVote::preclaim (AMMVote.cpp:59-77), in rippled's order: an emptied pool (LPTokenBalance zero) is tecAMM_EMPTY — new TxResult::AmmEmpty — then a voter holding NO LP tokens is tecAMM_INVALID_TOKENS, "AMM Vote: account is not LP." Judged by ammLPHolds, where a missing line holds nothing. Our preclaim checked only that the voter's account exists, so the vote landed as a fee-only tesSUCCESS (the VoteSlots write needs …
- **fix(xrpl-ledger): AMMDeposit re-judges each ACTUAL amount before sending it** (`c91e670`, xrpl-validator) rippled's funds test runs TWICE, and we ran neither half fully. Preclaim's balance lambda (AMMDeposit.cpp:230-252) judges the STATED amounts on the pre-fee balance — we had its XRP arm but skipped IOUs entirely; the IOU arm (accountFunds under IgnoreFreeze, issuer never short, no INSUF_RESERVE_LINE split) is now ported. deposit()'s checkBalance (AMMDeposit.cpp:514-538) then re-judges each DERIVED actual right before …
- **fix(xrpl-ledger): NFT accept judges the buyer's reserve when the transfer creates a page** (`2056087`, xrpl-validator) fixNFTokenReserve (NFTokenAcceptOffer.cpp:378-399, transferNFToken): when insertToken has to CREATE a page for the buyer, rippled refuses with tecINSUFFICIENT_RESERVE unless the buyer's balance AS IT STANDS — post-fee, post-price, deliberately NOT the pre-fee form the Mint/CreateOffer gates use — covers accountReserve(ownerCountAfter). Ported into transfer_token so the direct and brokered arms inherit it from the …
- **fix(xrpl-ledger): a mint that carries Amount inherits the OFFER's rules too** (`4ae3e03`, xrpl-validator) ★ A TRANSACTION THAT IS TWO OPERATIONS INHERITS BOTH SETS OF RULES. `NFTokenMint::preclaim` hands off to `nft::tokenOfferCreatePreclaim` when the transaction carries `Amount` — the mint also creates a sell offer — and that helper refuses a destination which has switched incoming NFT offers off: if (sleDst->isFlag(lsfDisallowIncomingNFTokenOffer)) return tecNO_PERMISSION; (NFTokenHelpers.cpp:885-892)

- **fix: AMM zero-side refusal, NFTokenCancelOffer permissions, default-path book** (`12ddc7c`, xrpl-validator) Three rules, gated together on a stable binary.
- **fix(xrpl-ledger): NoRipple on the destination's line blocks the step out of a book** (`db5e428`, xrpl-validator) A `DirectStepI` that immediately follows a BOOK step is refused when the SOURCE side of its trust line carries NoRipple (DirectStep.cpp:440-445): if (ctx.prevStep->bookStepBook()) if (sleLine->isFlag((src_ > dst_) ? lsfHighNoRipple : lsfLowNoRipple)) return terNO_RIPPLE;
- **fix(xrpl-ledger): a credential is unlinked from BOTH directories, and the reserve follows acceptance** (`3e02ee6`, xrpl-validator) `deleteSLE` (CredentialHelpers.cpp:74-124): delSLE(issuer, sfIssuerNode, !accepted || (subject == issuer)); if (subject != issuer) delSLE(subject, sfSubjectNode, accepted); view.erase(sleCredential);
- **fix(xrpl-ledger): cashing a check releases the check's own reserve** (`92d8222`, xrpl-validator) rippled states it twice. Preclaim: // "src will have one reserve's worth of additional XRP once the check is // cashed, since the check's reserve will no longer be required" if (value.native()) availableFunds += XRPAmount{ctx.view.fees().increment}; (CheckCash.cpp:175-181)
- **fix(xrpl-ledger): NFTokenModify checks mutability and the issuer's authorised minter** (`39df833`, xrpl-validator) `NFTokenModify::preclaim`, after the existence test: if ((getFlags(id) & kFlagMutable) == 0) -> tecNO_PERMISSION if (issuer != account) { minter = issuer's sfNFTokenMinter; if (minter != account) -> tecNO_PERMISSION }
- **fix(xrpl-ledger): PaymentChannelCreate refuses DisallowIncomingPayChan and pseudo-accounts** (`74a4d42`, xrpl-validator) Two checks rippled makes in `PaymentChannelCreate::preclaim` and we did not (PaymentChannelCreate.cpp:92-113), in its order: tecNO_DST -> lsfDisallowIncomingPayChan -> lsfRequireDestTag -> isPseudoAccount
- **fix(xrpl-ledger): a brokered accept must check BOTH offers' Destination** (`140d982`, xrpl-validator) In brokered mode rippled tests each offer's `Destination` against the SUBMITTER, in preclaim, before the broker-fee arithmetic: if (auto const dest = bo->at(~sfDestination); dest && *dest != ctx.tx[sfAccount]) return tecNO_PERMISSION; // and the same for so (NFTokenAcceptOffer.cpp:115-126)
- **fix(xrpl-ledger): the bridged walk never crossed an expired offer either** (`2aa1274`, xrpl-validator) `live_head` — the stepper the BRIDGED walk advances with — did not test `Expiration`. The DIRECT walk has tested it since #105776250 and `reap_to_live_head` tests it too; the sibling did not. `hasExpired` is inclusive against the BASE ledger's close time (View.cpp:48; BookStep.cpp builds the stream with `sb.parentCloseTime()`), and rippled's stream collects them as removable — it logs "Removing expired offer" by …
- **feat(probe): DX_FILL on the bridged legs, and lift the saturating key cap** (`8ef6ea5`, xrpl-validator) Two instruments, both inert unless their env var is set.
- **fix(xrpl-ledger): the strand upper bound charges the intermediate gateway's cut** (`6fb6cf7`, xrpl-validator) A payment book step composes its quality with `trIn` — the transfer rate of the book's IN currency when the previous step redeems — in `BookPaymentStep::adjustQualityWithFees` (BookStep.cpp:338-360), and that is what feeds `qualityUpperBound`. Offer crossing deliberately WAIVES the fee ("assume no fee is charged, or the estimate will no longer be an upper bound", BookStep.cpp:519-524); a PAYMENT does not. …
- **fix(xrpl-ledger): a pseudo-account cannot receive an escrow** (`8e48764`, xrpl-validator) `EscrowCreate::preclaim` refuses a pseudo-account destination with tecNO_PERMISSION immediately after the tecNO_DST read, BEFORE the token helper and before the tag test (EscrowCreate.cpp:350-352). It is deliberately not amendment-gated, because every write to a discriminator field is.

- **fix(xrpl-ledger): the balance clamps the GROSS, and a pass that misses limitQuality is discarded whole** (`23f1153`, xrpl-validator) Two coupled rules behind an IoC cluster one bot repeated every ledger — 11 ledgers, 24 divergences, 77% of everything open. Neither rule fixes it alone.
- **fix(xrpl-ledger): a terminal issuer-only change ripples between gateways, never a book** (`04d6c8b`, xrpl-validator) toStrand appends a terminal order book for the delivered asset only when the CURRENCY changes (PaySteps.cpp:220-233); its own comment is explicit — "for offer crossing (only) we do use an offer book even if all that is changing is the Issue.account". A PAYMENT whose last hop already holds the delivered currency under a DIFFERENT issuer therefore gets no book at all: the delivery issuer enters normPath as an ACCOUNT …
- **fix(xrpl-ledger): a rested XRP residual rounds by mulRound, not by a plain ceiling** (`a8b01c7`, xrpl-validator) The bookend to `ff1e752`. There, `TOffer::limitOut` uses `ceilOutStrict` and gets a TRUE ceiling. Here, `flowCross`'s residual uses plain `mulRound`: afterCross.in = mulRound(afterCross.out, rate, takerAmount.in.asset(), true);
- **fix(xrpl-ledger): NFTokenBurn takes the token's OUTSTANDING OFFERS with it** (`1559d5f`, xrpl-validator) We removed the token from its page and bumped BurnedNFTokens, and stopped — leaving offers pointing at an NFT that no longer exists. `NFTokenBurn::doApply` deletes up to 500, SELL directory first: std::size_t const deletedSellOffers = nft::removeTokenOffersWithLimit(view(), keylet::nftSells(id), kMaxDeletableTokenOfferEntries); if (kMaxDeletableTokenOfferEntries > deletedSellOffers) …
- **fix(xrpl-ledger): AccountDelete walks the owner DIRECTORY — OwnerCount 0 is not "owns nothing"** (`a31296a`, xrpl-validator) Our only gate was `OwnerCount == 0`. #106322004 77C5E61D has OwnerCount 0 AND owns an Escrow, and those are not contradictory: an escrow that names this account as DESTINATION is linked into its owner directory, but the reserve sits with the escrow's CREATOR, so the destination's count never moves. The count says "owns nothing" while the directory says otherwise.
- **fix(xrpl-ledger): a tfSell FillOrKill completes on its FUNDED input, not on TakerGets** (`91cdc47`, xrpl-validator) rippled calls `flow(..., partialPayment = !tfFillOrKill, ...)`, so a FillOrKill offer either completes or moves nothing — and completion is the OUT side for a BUY (TakerPays delivered in full) but the IN side for a SELL. A sell bounded by the taker's own funding is complete when those funds are spent: `flowCross` clears BOTH sides of the remainder ("If offer crossing exhausted the account's funds don't create the …
- **fix(xrpl-ledger): AMMWithdraw splits "no LP tokens" from "too few" — and the pool's own lines get hydrated** (`e982148`, xrpl-validator) `AMMWithdraw::preclaim` (AMMWithdraw.cpp:272-288) distinguishes two failures we collapsed into one: if (lpTokens <= beast::kZero) return tecAMM_BALANCE; // holding NONE if (*lpTokensWithdraw > lpTokens) return tecAMM_INVALID_TOKENS; // holding TOO FEW
- **feat(xrpl-ledger): DepositAuth — a payment needs the destination's permission** (`51300d1`, xrpl-validator) We had NO DepositAuth support at all: before this the only occurrence of the term in the crate was a comment about which flags an AMM account carries. So an account that had explicitly closed itself to unsolicited payments received them from us anyway.
- **fix(xrpl-ledger): AccountDelete removes the owner DIRECTORY, not just the account** (`b301e07`, xrpl-validator) rippled's teardown erases the directory explicitly, before the account (AccountDelete.cpp): Keylet const ownerDirKeylet{keylet::ownerDir(accountID_)}; … if (view().exists(ownerDirKeylet) && !view().emptyDirDelete(ownerDirKeylet)) view().update(dst); view().erase(src);
- **fix(xrpl-ledger): ceilOut CLAMPS the input to the offer's own, and either side at zero consumes it** (`853e75a`, xrpl-validator) Two symptoms, one missing rule. `ceilOutImpl` ends with a step that is explicit in

rippled's source, not a rounding artefact (Quality.cpp): Amounts result(MulRoundFunc(limit, quality.rate(), amount.in.asset(), roundUp), limit); // Clamp in if (result.in > amount.in) result.in = amount.in;

- **fix(harness): hydrate the NFT offer CREATOR's pages, not just the token's owner** (`fbb4f96`, xrpl-validator) `load_nft_pages_for_tx` took `Owner` OR `Account` for NFTokenCreateOffer. On a BUY offer `Owner` is the token's current holder — the seller — so the creator was skipped, and the creator is precisely the party who will RECEIVE the token.
- **fix(xrpl-ledger): the AMM anchors only on a tip the taker could actually trade** (`1a96950`, xrpl-validator) `tryAMM` is handed `offers.tip().quality()`, and a tip beyond the taker's limit is not a tip the offer stream ever reaches — rippled then calls it with NO clob quality, which is `maxOffer`, and `limitOut` trims that to the limit instead. Our direct-walk AMM turn ran BEFORE the `q > threshold` break and anchored the slice to a level the taker had already rejected, sizing the fill off a price that was never available.
- **fix(xrpl-ledger): NFTokenAcceptOffer weighs the buyer's funds — and the probe lets it see them** (`9c0d845`, xrpl-validator) 9 of the 13 divergences in the 2026-08-14 fresh sweep were one cluster: `our_ter=tecOBJECT_NOT_FOUND` against `net_ter=tecINSUFFICIENT_FUNDS`, 1 mutation each side. TWO defects stacked, and fixing either alone measures WORSE than fixing neither.
- **fix(xrpl-ledger): every payment strand runs ONE PASS — corpus byte parity 0 hits** (`950e63e`, xrpl-validator) The third and last part of the iteration model, and the SAME `if multi` gate the rounds carried in `4566c4e`. A pass ends when an offer is CONSUMED and `flow()` re-enters the strand; `single_pass` already implements that, but it was switched on only for multi-strand payments, so a lone strand walked the whole book in one call and MERGED what rippled does in separate iterations.
- **fix(xrpl-ledger): rippleSend moves the sender's line ONCE, with the gross** (`bc756dd`, xrpl-validator) rippled's `rippleSend` (View.cpp) is one credit per party: saActual = saAmount + saTransitFee; rippleCredit(issuer, receiver, saAmount); // receiver gets the NET rippleCredit(sender, issuer, saActual); // sender pays the GROSS
- **fix(xrpl-ledger): limitOut takes the STRICT canonicaliser when the drops decide** (`ff1e752`, xrpl-validator) rippled's own comment on `TOffer::limitOut` (Offer.h:200): "It turns out that the ceil_out implementation has some slop in it, which ceil_out_strict removes." So an out-limited fill goes `ceilOutStrict` -> `mulRoundStrict` -> `canonicalizeRoundStrict`, not `mulRound`. After dividing down to offset -1 the two differ by one term (STAmount.cpp:1477 vs :1516): canonicalizeRound value += 9; canonicalizeRoundStrict value …
- **fix(xrpl-ledger): the bridge's direct head prices a partial fill at the filed rate** (`7f8286b`, xrpl-validator) The rule `e2a9c99` gave the two bridge legs, never given to the third fill site in the same function. An offer carries two rates: the one it is FILED under (low 64 bits of `BookDirectory`, a 16-digit mantissa fixed at creation) and its current TakerPays/TakerGets, which drifts every time a residual is re-rounded. rippled prices a PARTIAL fill at the filed rate and a FULL one at the amounts.
- **feat(xrpl-ledger): one AMM consumption per payment-engine iteration** (`4566c4e`, xrpl-validator) "At any payment engine iteration, AMM offer can only be consumed once" (BookStep.cpp:818). When a payment wants more pool liquidity than one AMM offer gives, rippled ENDS the pass and `flow()` re-enters the strand for the next one — and every iteration writes the maker's residual, so N iterations are N roundings. We took Fibonacci slices inside a single pass and rounded once.
- **fix(xrpl-ledger): ask the walk what a strand spent, don't difference the balance** (`8d8d2e6`, xrpl-validator) Third instance of the defect `44c20d9` fixed for a hop's carry and `45a7092` for the reverse pass — and exactly the `signed_add(before, !after)` shape 45a7092's note said to go looking for. `strand_pass` reported its input

consumption by differencing the sender's spend-leg balance, and a balance holds 16 significant digits TOTAL, so whatever the sender already holds of the spend currency eats the low end of the …

- **fix(xrpl-ledger): the precise measurement must account for the fee the walk debits** (`1f31546` , xrpl-validator) A defect in `45a7092` . Its precise path is `granted - rem_in` , but `rem_in` tracks only the NET the walk moved — the input transfer fee is debited SEPARATELY by `line_adjust` . So on a fee-bearing hop `precise` is the net while the differenced balance `d` is the gross, the two disagree by the WHOLE FEE (1e-3 for a 1.001 issuer, a thousand times the 1e-9 agreement threshold), and the guard rejected the precise value …
- **fix(xrpl-ledger): measure the REVERSE pass's consumption precisely too** (`45a7092` , xrpl-validator) `44c20d9` fixed the forward carry and I did not notice the same defect one level up. `measure_hop` worked out how much a trial consumed by differencing a GRANTED balance — 16 significant digits TOTAL, so the grant itself eats the low end of the answer — while `cross_engine_to` was already RETURNING the precise remaining input and the code threw it away with `let (rw, _, _) = ...` .
- **fix(xrpl-ledger): reprice a rested remainder in BOTH directions** (`afb133f` , xrpl-validator) The one-way clamp on the reprice — take `derived` only when it moves the residual DOWN — was a workaround for #105930662 40FB322EC16C from when the reprice still used the RAW ratio. `070ca31` fixed the rate itself and that ledger is byte-exact now, so the guard had outlived its cause and did nothing except suppress the reprice wherever it needed to move the residual UP.
- **fix(xrpl-ledger): measure a hop's carry at full precision, not by differencing** (`44c20d9` , xrpl-validator) The forward pass measured what a hop produced by differencing the sender's BALANCE. A balance holds 16 significant digits TOTAL, so whatever the sender already holds of the intermediate eats the low end of the addend — the hop is fine, the measurement is not.
- **fix(xrpl-ledger): an INPUT-limited fill rounds the offer's output DOWN** (`ca17418` , xrpl-validator) BookStep.cpp:653, verbatim, with rippled's own rationale above it: ofrAmt = offer.limitIn(ofrAmt, inLmt, / *roundUp* / false);
- **fix(xrpl-ledger): stamount_signed_add ROUNDS its operands, not truncates** (`6798100` , xrpl-validator) An STAmount operand is already canonical in rippled — it was rounded to 16 digits when it was produced — so reducing an over-precise operand by truncation drops exactly the digit that decides the result. `norm16` truncates.
- **fix(xrpl-ledger): reprice a rested remainder at the ENCODED ratio** (`070ca31` , xrpl-validator) Two changes to `offer.rs` ; only the second moves any ledger.
- **fix(xrpl-ledger): charge the input transfer fee once — the walk owns it** (`41ef4ac` , xrpl-validator) `payment.rs` and `offer.rs` both quoted BookStep.cpp:770 and both applied the issuer's rate, and neither comment knew the other existed. `measure_hop` GRANTS a balance and differences it, and the walk debits the fee per fill, so the fee was already inside `consumed` before the reverse pass grossed it up again — the rate compounded.
- **fix(xrpl-ledger): price bridged fills at the filed BookDirectory rate** (`e2a9c99` , xrpl-validator) An offer carries two rates and they are not the same number: the rate it is FILED under (low 64 bits of `BookDirectory` , 16-digit mantissa, fixed at creation) and its current `TakerPays / TakerGets` , which drifts every time a residual is re-rounded. rippled prices a PARTIAL fill at the filed rate and a FULL one at the offer's own amounts. The direct walk has done this since `full_offer` ; `cross_bridged` priced both …
- **fix(xrpl-ledger): store offer residuals at STAmount precision, not exactly** (`4556384` , xrpl-validator) `TOffer::consume` subtracts through STAmount, so a maker's remaining side comes back rounded to 16 significant digits (half-even, via `Number` under fixUniversalNumber). `me_sub` is EXACT — it keeps every digit

— so whenever `gives0 - give` needed more than 16 digits we stored precision the ledger cannot hold and rippled does not have. Being more precise than rippled is a defect: the validator serialises the stored …

- **fix(xrpl-ledger): multiPath prices a clamped pool fill at the OFFER's quality** (`4a97124` , xrpl-validator) OfferCreate >=1000-ulp cluster 14 -> 5 hits from one rule. #105802230 EF1642A9, #105284280 BE7884AA and #105666830 A8830CA4 go fully clean; #105930662 40FB322E and #105954798 D5887FD7 each drop to one.
- **fix(xrpl-ledger): the DIRECT walk charges the input issuer's transfer fee too** (`cf36009` , xrpl-validator) #105877543 435A9AEB -> 0 hits. It is the specimen the direct walk was missing when this was attempted and reverted earlier on 2026-08-11 for want of a failing ledger.
- **fix(xrpl-ledger): withdraw-all pays two rounded steps, not a fused muldiv** (`81180a1` , xrpl-validator) Closes the last AMM hit. #105796380 2437575D goes AMM-clean; the AMM value family is now ZERO, from 11 this morning.
- **fix(xrpl-ledger): port rippled's Newton-iteration square root** (`36a6fdb` , xrpl-validator) AMMDeposit 4 -> 0. #105779597 and #105828322 go fully clean; the AMM family drops 5 -> 1, and only a tfWithdrawAll hit remains.
- **fix(xrpl-ledger): a single-asset withdrawal pays what its adjusted tokens are worth** (`bbf6ee3` , xrpl-validator) AMMWithdraw 7 -> 1 hits. #105816437 AC7713F9 and #105838164 181F8088 go fully clean; the AMM family drops 11 -> 5.
- **fix(xrpl-ledger): Number division DISCARDS its remainder at the 16-digit scale** (`e7183b3` , xrpl-validator) 129 -> 74 byte-parity hits, 43% of the backlog, from one line. Payment 89 -> 42, OfferCreate 29 -> 21, no key-level regressions.
- **feat(xrpl-node): DX_VALCHECK compares EXACTLY, at STAmount precision** (`adca53a` , xrpl-validator) The target is byte parity: a validator serialises the stored decimal into the SLE and hashes it, so one digit apart is a different state hash and a diverged node however small the number. The old check could not certify that — it parsed both sides into f64 and compared against a 1e-12 tolerance.
- **fix(xrpl-ledger): an XRP residual ceils to whole DROPS, not to 16 digits** (`df3c8f2` , xrpl-validator) #105672435 B409D45C -> 0 hits, 118/118. It was the largest genuine error left (6.05e-6) and the last one above 2e-6.
- **fix(xrpl-ledger): to_amount honours round-to-NEAREST instead of flooring it** (`6de2684` , xrpl-validator) Closes the largest remaining cluster: #105843839 C1F9FB1F, 6 hits -> 0. That ledger now carries one pre-existing 1.5e-11 Payment residue and nothing else, 125/125.
- **fix(xrpl-ledger): a bridged taker pays the input issuer's transfer fee** (`94a028e` , xrpl-validator) Closes the two largest remaining OfferCreate errors. #105887283 4A13D048 goes 88/88 with no DX_VALCHECK output at all; #105954798 D5887FD7 drops from 1.34e-4 to 2.0e-11.
- **fix(xrpl-ledger): a payment charges the input issuer's rate on EVERY hop** (`5c16b88` , xrpl-validator) Payment value hits 12 -> 4. #105924683 B3AA3ACC — the largest remaining error in the whole backlog at 2.96e-3, 5 hits — closes outright: 73/73 with no DX_VALCHECK output.
- **fix(xrpl-ledger): a fully-consumed offer transfers its own amounts verbatim** (`dd4991a` , xrpl-validator) OfferCreate value hits 48 -> 26 across the ledgers carrying them, with the XRP family almost gone (AccountRoot.Balance 18 -> 2). No mutation-set regressions.
- **fix(xrpl-ledger): a single-asset deposit pays what its adjusted tokens are worth** (`5197c37` , xrpl-validator) CLOSES THE AMM VALUE FAMILY: 23 hits at gate 46 -> 0. #105813899 2C8C37F9 was the last one, 55/55 with no DX_VALCHECK output at all.

- **fix(xrpl-ledger): real LP token math for two-asset deposits and all withdrawals** (`c9ac386`, xrpl-validator) Removes the last of the 1e7 LPToken placeholders from the deposit/withdraw paths. AMMWithdraw 7 -> 0 hits, AMMDeposit 7 -> 3; the AMM value family is now 3, from 23 at gate 46.
- **fix(xrpl-ledger): quantize a deposit's LP mint to the pool balance's ulp** (`acf49ab`, xrpl-validator) SETTLES THE MANTISSA-SCALE QUESTION, which `85bb7df` left open as the suspected cause of the single-asset deposit precision tails. It is NOT the cause.
- **fix(xrpl-ledger): mint real LP tokens for AMMCreate and single-asset deposits** (`85bb7df`, xrpl-validator) Both mint sites were hardcoded 1e7 placeholders, documented as "the magnitude is oracle-corrected downstream". They were 23 of the 83 value divergences at gate 46 and by far the largest in the backlog — relative errors up to 3e5, where the whole remaining OfferCreate tail sits below 2e-4.
- **fix(xrpl-node): choose the hydration RPC per LEDGER, not per sweep script** (`25c9e31`, xrpl-validator) The gate corpora AGE OUT of our LAN validator's rolling window (~290k ledgers on 2026-08-10, 105919185-106209950), so a fixture that hydrated locally last month must come from s2 today. A server pinned per script cannot express that, and both failure directions were live: * `batch2sweep.sh` pins `--rpc <lan>` while 7 of its 26 ledgers had rolled out of the window (105909285 105909624 105910649 105911834 105912291 …
- **fix(xrpl-ledger): match rippled's AMM slice sizing on direct offer crossing** (`b2c47da`, xrpl-validator) Two coupled rules, both read off libxrpl's own trace of #106143011 4607B92B against the RLUSD/XRP pool and confirmed in rippled's source.
- **fix(xrpl-ledger): a payment pays the INPUT issuer's TransferRate** (`c99ebb2`, xrpl-validator) `apply_path_payment` charged the OUTPUT issuer's rate (`want_rate`) and let the input through free. A payment sets `ownerPaysTransferFee_ = false`, so `trIn = transferRate(book_.in.account)`: the SENDER parts with `amount × rate` and the counterparty receives `amount` (BookStep.cpp:737-739). `apply_iou_direct` has always done this for the same-currency case — the crossing path never did.
- **fix(xrpl-ledger): reprice bridged leg A after the mid-leg rounds up** (`07f2e32`, xrpl-validator) 9bb5ceb rounded the bridged XRP mid-leg UP to whole drops and left `gets_in` priced from the FRACTIONAL value it had before. So leg A took a whole drop and paid for a fraction less of one, every time the rounding did anything.
- **fix(xrpl-ledger): the bridged XRP mid-leg must CEIL to whole drops, not truncate** (`9bb5ceb`, xrpl-validator) Autobridged crossing routes value through XRP, and that mid-leg has to land on whole drops. `cross_bridged` truncated it — `me_rescale(xrp, 0, false)` — so one leg moved a drop more than the other could absorb and the pass came out skewed in both directions at once.
- **feat(xrpl-ledger): DX_CLAMP — and it retires the ceil_in flip for good** (`9e475fe`, xrpl-validator) The 2026-08-08 attempt to flip the taker-clamped XRP floor to a ceil regressed #105284280 (78/78 -> 77/78) and took #105091578 from 0 value hits to 21. The note left behind said the next attempt had to establish, first, whether the twelve one-drop-short residuals reach that branch at all.
- **fix(xrpl-node): prefetch NFT pages for NFTokenModify — it is tt 61, not 25..=29** (`5aad67e`, xrpl-validator) `is_nft_tx_type` was `(25..=29).contains(&tt)` — Mint, Burn, CreateOffer, CancelOffer, AcceptOffer. NFTokenModify (XLS-46) is tt 61: it POSTDATES that contiguous range, so a transaction whose entire job is to locate a token and rewrite its URI never had the owner's NFTokenPages fetched. libxrpl's `nft::findToken` then searched a page set that was never loaded and returned tecNO_ENTRY on a token that plainly exists.
- **fix(xrpl-ledger): token escrow — Cancel and Finish never released the token** (`6ef30c4`, xrpl-validator) #106179351: 413 txs, 221 matched. `EscrowCancel attempted=192 MATCH=0 DIVERGE-MUT=192` -- every

EscrowCancel in the ledger, all the same shape, ours 3 mutations against mainnet's 8. FFI PROBE: CLEAN, so ours.

- **feat(xrpl-node): FFI_VALCHECK — the oracle rule now works at VALUE level** (`c7d4625`, xrpl-validator) `PROBE: CLEAN` has only ever meant libxrpl touched the same OBJECTS mainnet did. It never said libxrpl wrote the same NUMBERS, because the entire parity verdict is a mutation-KEY comparison. So when 9bc95c8 made value divergences visible on the native side, there was no way to attribute them: 175 value hits and no verdict on whether any of them were ours.
- **fix(xrpl-ledger): rank payment strands by UPPER BOUND, not by a realised trial** (`0f55ba5`, xrpl-validator) `payment.rs`'s round loop trialled every strand, measured what each pass actually delivered, and picked the best spent-per-delivered. That is the model this repo already REFUTED for offer crossing in 03c2cb9 -- `ActiveStrands::activateNext` sorts by `qualityUpperBound` best-first, DROPS any strand whose bound misses limitQuality, and the loop takes the first candidate whose pass is not rejected, `continue`-ing past …
- **feat(xrpl-ledger): one strand per named path, and stop gating hops with the payment's limit** (`868cf89`, xrpl-validator) #106156904 341030105165 -- ours tecPATH_DRY with 1 mutation vs mainnet tesSUCCESS with 7. Circular tfPartialPayment|tfLimitQuality, SendMax 7.203545999999999 USDT for 0.095 SOL, and `Paths` carries SIX paths.
- **fix(xrpl-ledger): NFTokenCreateOffer never charged for the object it creates** (`a56ccbd`, xrpl-validator) #106154459 A55AD53EEFA2 -- ours tesSUCCESS with 5 mutations vs mainnet tecINSUFFICIENT_RESERVE with 1. All five EXTRA: the NFTokenOffer plus both directory pages.
- **fix(xrpl-ledger): a rested residual keeps its ORIGINAL quality in its AMOUNTS** (`850da82`, xrpl-validator) The book page for a partially crossed offer has always been built from the offer as REQUESTED (`tp0`/`tg0`) -- rippled keeps a partial fill at its original price. The AMOUNTS written into that offer did not follow: they were `TakerGets - consumed`, i.e. reduced by the currency actually handed over.
- **feat(xrpl-node): DX_VALCHECK — compare the VALUES we wrote, not just the keys** (`9bc95c8`, xrpl-validator) The differential probe's verdict is a mutation-set comparison, and a mutation set is KEYS. Every value a transaction writes is invisible to it.
- **fix(xrpl-ledger): a bridge leg-B maker cannot deliver more than it holds** (`5dc7cb7`, xrpl-validator) #106146362 75511674AD58 -- tfSell OfferCreate, 1000 XAH for 1 RLUSD, autobridged XAH->XRP->RLUSD. Both engines tesSUCCESS; ours 11 mutations against mainnet's 16, 5 missing, none extra.
- **fix(xrpl-ledger): size the reverse-pass grant to the requirement it measures** (`125be81`, xrpl-validator) #106148286 4EFC975484E1 -- Payment, ours tecPATH_PARTIAL vs net tesSUCCESS, 1 mutation against 9. Circular tfPartialPayment|tfNoRippleDirect, SendMax 0.02117670765212899 mXRP for 2.302493172774841 CORE over a FOUR-leg chain of pools, mXRP -> BitX -> BTC -> CORE. One strand, so 89bed1e is inert here: same symptom as #106143011, different regime.
- **fix(xrpl-ledger): tfNoRippleDirect forbids the strand we fall back to** (`7d785ec`, xrpl-validator) #106146562 C56D61917E4B -- Payment, ours tesSUCCESS with 4 mutations vs net tecPATH_DRY with 1. Three EXTRA nodes, none missing.
- **fix(xrpl-ledger): the reverse pass must size for the pass the forward one runs** (`89bed1e`, xrpl-validator) #106143011 5D327F343A54 -- Payment, ours tecPATH_PARTIAL vs net tesSUCCESS, 1 mutation against 33. Circular tfPartialPayment, SendMax 100 SPY into 18.00944028251864 RLUSD via SPY->XRP->RLUSD, DeliverMin 17.91939308110604.

- **fix(xrpl-ledger): destination checks across every transactor that has them** (`b569fa9`, xrpl-validator) 5626357 fixed destination-check ORDERING in payment.rs and I called the class closed. It was not: the very next fresh batch found the same class wrong in a second Payment branch AND in a transactor I had not looked at. So this time I grepped every transactor that emits the code -- rippled has tecDST_TAG_NEEDED in SEVEN, we had it in TWO.
- **fix(xrpl-ledger): limitOut sizes a pass TO the limit — #106134431 closed 122/122** (`3033135`, xrpl-validator) Completes the AMM bridge slice-sizing family. Every divergence from the 2026-08-07 fresh batch now matches mainnet.
- **fix(xrpl-ledger): single-path AMM takes maxOffer, clamped through the pool BOTH ways** (`3180e04`, xrpl-validator) Closes #106137477 `CD634127CD8B` (86/87 -> 87/87) and wires in the `max_offer` built in a171405. The clamp that a171405 named as "the missing half" turned out to be TWO-directional, which is what defeated that attempt.
- **feat(xrpl-ledger): max_offer — rippled's single-path AMM slice, trace-exact** (`a171405`, xrpl-validator) Groundwork for the AMM bridge slice-sizing family, with the two specimens from the 2026-08-07 batch. NOT wired in; see below.
- **fix(xrpl-ledger): a payment crosses the payer's own offer** (`8d8ca2d`, xrpl-validator) #106137720 `F2C989D4843A`, from the 2026-08-07 fresh batch. FFI leg clean, so the pre-state was sound and the engine was wrong.
- **fix(xrpl-ledger): destination checks come before the funding check** (`5626357`, xrpl-validator) #106136429 `6FF692D40C4F`, from the 2026-08-07 fresh batch. The FFI leg was clean, so the pre-state was sound and the engine was wrong.
- **refactor(xrpl-ledger): remove DX_SEL — it now compares an abandoned model** (`17a99ef`, xrpl-validator) DX_SEL was added in dbb9110 to find a ledger where our estimate-based strand selection differed from rippled's upper-bound one. It found the answer, the answer was acted on, and the detector outlived its premise: since 03c2cb9 the engine SELECTS by that upper-bound model (`order`), so DX_SEL was comparing an abandoned model against the live one and reporting "mismatches" that described nothing real.
- **fix(xrpl-node): prefetch the NFT offer's OWNER — the accept names it by hash** (`60fb653`, xrpl-validator) Root cause of #105663160 `5CCAAE138F560F07`, and it is OURS, not rippled's.
- **fix(xrpl-node): the FFI oracle replayed every old fixture under TODAY'S rules** (`a191b79`, xrpl-validator) Re-minting the stale freshfinds/105663160 fixture (it lacked `tx_json` and had been skipped by every gate since 24 July) surfaced this.
- **feat(xrpl-ledger): DX_ULP — the 1-ulp upper bound is unobservable, and the note was backwards** (`f2d9d9a`, xrpl-validator) Hunted for a ledger where the composed upper bound's last digit decides an admission, per the open item in 005ad9a. There isn't one.
- **fix(xrpl-ledger): a rejected candidate's offer removals must survive its rollback** (`a836f94`, xrpl-validator) Hunted for a ledger exercising the ofrsToRm deviation noted in 03c2cb9. There isn't one: DX_RM swept all 144 staged fixtures (batch2, newfinds, freshfinds, corpus) and reported ZERO cases where a rejected candidate's rollback discarded a reap. The one hit, #105912454, is the benign kind -- offers the fill CONSUMED, which rippled discards too, since it drops the failed strand's sandbox and carries out only ofrsToRm.
- **fix(xrpl-ledger): strand selection — upper-bound order with fall-through** (`03c2cb9`, xrpl-validator) The judge and the fall-through are ONE mechanism, which is why building the judge alone failed twice (recorded 8 v 17: it rejects the leading candidate and then crosses nothing).

- **fix(xrpl-ledger): the bridge strand's upper bound must not charge the transfer fee** (`005ad9a`, xrpl-validator) rippled states the rule outright in adjustQualityWithFees (BookStep.cpp): "It is important that `qualityUpperBound` is an upper bound on the quality (it is used to ignore strands whose quality cannot meet a minimum threshold). When calculating quality assume no fee is charged, or the estimate will no longer be an upper bound." It therefore returns ofrQ UNCHANGED for a CLOB tip and for a multi-path AMM, and even in …
- **feat(xrpl-ledger): DX_SEL — measure strand selection against rippled's model** (`dbb9110`, xrpl-validator) Settles what rippled actually does, and relocates the defect.
- **fix(xrpl-ledger): auth is not an interest in a trust line** (`f3f8b98`, xrpl-validator) rippled's bLowReserveSet/bHighReserveSet (SetTrust.cpp:611-620) are exactly quality-in, quality-out, NoRipple-vs-DefaultRipple, freeze, limit and balance. We also tested lsfLowAuth/lsfHighAuth, so a single authorisation bit pinned a zero-balance, zero-limit line open forever.
- **fix(ledger): a hydrated maker with no line for what it sells holds ZERO** (`44d7a1c`, xrpl-validator) #106096771 354/354 (was 352/354) and #106101763 224/224 (was 223/224) — three divergences across two independent ledgers, one root cause. Both came from the 2026-08-06 fresh scout batch, and #106101763 was never looked at while making the change: the first evidence this run that a fix generalises rather than fitting the ledger it came from.
- **fix(probe): a dropped fetch is not a divergence — withhold the verdict** (`cae6b85`, xrpl-validator) Both probes conflated "the network dropped this fetch" with "this object does not exist", so an incomplete pre-state replayed into a plausible, well-formed divergence. #106099077 is what prompted this: the scout filed two `tecPATH_DRY vs tesSUCCESS` circular-arb Payments on the FFI leg, with a triage note blaming the offer-book directory walk and `succ`/overlay merge. Re-running the same fixture on the same binary — …
- **fix(ledger): price an IN-limited fill through the encoded quality too** (`7ff7a13`, xrpl-validator) #105843839 02A79DBAD8BD: 11 mutations against 13. Now 125/125 — and every leg of the gate is FULLY CLEAN, 0 divergences anywhere.
- **fix(ledger): one flow-wide AMM fib counter in cross_bridged, not one per leg** (`178e853`, xrpl-validator) #105876680 26AF14542086: 10 mutations against 5, all five extra. Now 32/32, and newfinds goes 62/63 — ONE divergence left on the whole board.
- **fix(probe): load the tail's predecessor page, and compare pointers by VALUE** (`c89601c`, xrpl-validator) #105886344 E430B7E92B22: 9 mutations against 7. Now 40/40, and newfinds goes 61/63. Both defects are in the PROBE, not the engine — neither side crosses anything here (`FLOWDBG strand 0 strandQ 5.480509506737132 limitQuality 4.007486192099164 admitted false`, Total flow 0/0; our DX_PLACE says `crossed=0`). `parity_probe` stayed CLEAN throughout, which is the documented tell for a harness bug: libxrpl reads through a …
- **fix(ledger): per-fib-slice AMM granularity in the multi-strand payment loop** (`64dc440`, xrpl-validator) #105912291 2AE3693EF556: 10 mutations against 9. Now 213/213 — and batch2 is **26/26, ZERO divergences**, down from 5 at the start of this run.
- **feat(ledger): DX_PAY round line before the loop's breaks** (`f0f311e`, xrpl-validator) Diagnostic only, behind the existing `DX_PAY` env var. The round print sat AFTER both `break`s, so the round that ended the loop never printed and it looked like the multi-strand loop ran once. It runs twice; the print was lying by omission. Moved ahead of the breaks and given the round index, sin/sout and the multi flag.
- **fix(ffi): route the registry journal to the capturing sink so Payments trace** (`0144f50`, xrpl-validator) An XRPL_FFI_TRACE of a Payment came back with four content lines and no flow logs at all, while an OfferCreate

on the same binary traced in full. The asymmetry is a null sink, not a missing JLOG.

- **fix(ledger): price an out-limited fill through the offer's encoded quality** (`9426fbe`, xrpl-validator) #105924683 E7399DA36A79: 9 mutations against 7. Now 73/73 — the ledger is fully clean. batch2 25/26, 1 divergence left.
- **fix(ledger): a single-path leg is priced by its pool's SPOT quality** (`01c41a0`, xrpl-validator) #105940336 CA2C624ED031: 6 mutations against 10. Now 199/199 — the ledger is fully clean. batch2 24/26, 2 divergences left.
- **feat(ledger): DX_HEADS/DX_RAWHEADS — per-leg book heads in the bridged walk** (`40cabb2`, xrpl-validator) Diagnostics only, both behind the existing `DX_BRIDGE` env var, nothing evaluated unless it is set. Added while chasing #105940336 CA2C624ED031 and kept because they answered two questions in one run each.
- **fix(ledger): the stream's dead tests apply to the taker's own offer too** (`37d5625`, xrpl-validator) #105949459 4A03010A4B1E: 4 mutations against 7. Now 178/178 — the ledger is fully clean.
- **fix(ledger): a bridged leg's pool prices the strand only while two are active** (`edf469a`, xrpl-validator) #105930662 40FB322EC16C: 6 mutations against 13, all 7 missing ones Modified, nothing extra. Now 45/45 — the ledger is fully clean.
- **fix(ledger): price an AMM bridge leg at the amount that actually flows** (`b18410f`, xrpl-validator) Four changes to the bridged crossing, all read off libxrpl's trace on #105912454 FE592890B233 (24 mutations against mainnet's 17).
- **fix(ledger): one AMM turn per pass, and a rejected pass ends the crossing** (`8152aca`, xrpl-validator) Three pieces, each only visible once the previous one landed, all read off libxrpl's own trace rather than inferred.
- **fix(ledger): judge a fill's achieved quality exactly, as rippled does** (`133fd89`, xrpl-validator) rippled discards a pass outright when the quality it actually realised misses the limit: if (limitQuality && q < *limitQuality && (!adjustedRemOut || !withinRelativeDistance(q,* limitQuality, Number(1, -7))))
- **fix(ledger): round a fill's XRP input by which side bounds it** (`d6f7589`, xrpl-validator) The taker's input was always ceiled to whole drops. rippled's direction depends on which side of the fill is fixed — its rev/fwd split: - the taker's remaining WANT bounds it: the input is computed FROM that output (`rev`) and rounds UP, so the taker pays enough; - the maker's FUNDING bounds it: the output is what is fixed and the input follows it (`fwd`), rounding DOWN.
- **feat(ffi): capture libxrpl's decision trace under XRPL_FFI_TRACE** (`8b5a197`, xrpl-validator) The shim already had a CapturingSink wired into xrpl_apply_with_mutations and surfaced through xrpl_result_last_fatal — but gated at Severity::Fatal, so everything rippled narrates was thrown away. Lift it to Trace when XRPL_FFI_TRACE is set, and dump it per transaction with XRPL_FFI_TRACE_TX=. Both OFF by default: gate runs stay byte-identical and trace capture is neither free nor small.
- **feat(ledger): reverse pass — size each payment hop to what the next needs** (`9ac6bcc`, xrpl-validator) rippled flows a strand in TWO passes: a REVERSE pass walking back from the requested output working out how much input each step needs (StrandFlow.h:105-230, `for (auto i = s; i--;) strand[i]->rev(...)`, re-executing a limiting step when one binds), then a FORWARD pass bounded by what is actually available. Ours was forward-only, so an intermediate hop sold its WHOLE carry rather than buying what the hop after it …
- **fix(ledger): the POOL can activate a strand, and an active strand reaps** (`6e631e7`, xrpl-validator) rippled filters strands on `qualityUpperBound` — an OPTIMISTIC bound on what the strand could conceivably do (StrandFlow.h:696-699, `qualityUpperBound(sb, *strand) < *limitQuality => continue`). For a book

with an AMM that bound includes the pool. A strand whose every BOOK level is worse than the limit therefore still gets built, its offer stream still steps, and the dead offers it steps past are still reaped — even …

- **feat(ledger): flow the default path alongside Paths, per pass** (`99f8a7a`, xrpl-validator) rippled ALWAYS builds the default path beside the ones named in Paths (unless tfNoRippleDirect), flows each strand, and applies the best-quality PASS each round before re-evaluating (StrandFlow.h:682-805). We ran the specified chain alone.
- **refactor(ledger): one strand code path in Payment** (`c858f1f`, xrpl-validator) The payment had two execution shapes — a hop chain when Paths named usable intermediate currencies, and a separate direct cross_engine_to otherwise. They were the same walk: with no hops the chain is [spend, want], the loop runs exactly one hop with last=true, benef=dest and want_cap=want_gross, and issues the identical cross_engine_to call the direct branch made. The inflight snapshot iterates `hops` and so is …
- **feat(ledger): AMMDeposit tfTwoAsset equalDepositLimit + tecAMM_FAILED** (`a533219`, xrpl-validator) Amount and Amount2 on a two-asset deposit are MAXIMA, not the amounts deposited. rippled derives one side from the other at the pool's ratio and fails the transaction outright when NEITHER derivation fits inside what was offered (AMMDeposit.cpp:721-787): frac = amount / amountBalance (Number, 16 digits) tokensAdj = adjustLPTokens(lpt, multiply(lpt, frac, DOWNWARD)) frac = tokensAdj / lpt (adjustFracByTokens) amt2Dep …
- **fix(ledger): measure a payment hop's carry, don't subtract a sentinel** (`7efe2fd`, xrpl-validator) An intermediate hop of a multi-hop payment has no real ceiling, so it was handed a sentinel want-cap of (9.99e15, 60) and its output recovered as `want_cap - remaining`. That cannot work. `me_rescale` saturates (saturating_mul), so rescaling the sentinel down to a fill's exponent pins it at u128::MAX — and it does so again on the NEXT fill, resetting the running remainder and ERASING every fill before it. The …
- **fix(ledger): remove self-crossed offers off the book tip** (`b733ae7`, xrpl-validator) rippled DELETES the taker's own offers off the tip rather than crossing them — BookStep.cpp:415-455 `limitSelfCrossQuality`, which explains the choice itself: "We could skip over the self offer in the book and only cross offers that are not our own. This would make a lot of sense, but we don't do it ... we can only operate on the tip of the order book. We can't leave an offer behind -- it would sit on the tip and …
- **fix(ledger): CredentialCreate joins both owner directories** (`be244f0`, xrpl-validator) A credential is inserted into the issuer's AND the subject's owner directory, but is owned only by the issuer — CredentialCreate.cpp:147-174: "Added to both dirs, owned only by issuer. CredentialAccept will transfer ownership to subject." So the issuer's dirInsert carries the single adjustOwnerCount(+1) and the subject's adds no reserve at all. A self-issued credential (subject == account) skips the subject insert …
- **fix(ledger): apply tfSetfAuth to the trust line** (`4bac28e`, xrpl-validator) We honoured tfSetfAuth in preclaim's redundancy test but never APPLIED it. `do_apply` handled tfSetNoRipple / tfClearNoRipple / tfSetFreeze / tfClearFreeze and had no branch for the auth bit, so a TrustSet whose only effect is authorisation left the line untouched entirely.
- **fix(ledger): align IOU addition the way STAmount does** (`d5a08c8`, xrpl-validator) `STAmount operator+` brings both operands to the LARGER exponent by integer division: while (ov1 < ov2) { vv1 /= 10; ++ov1; } while (ov2 < ov1) { vv2 /= 10; ++ov2; }
- **fix(probe): hydrate trust lines for the currencies named in Paths** (`549abb1`, xrpl-validator) We hydrated only the Amount and SendMax currencies, never the intermediate hops. A payment that ripples through a third currency therefore saw NO trust line for that hop, ran trustCreate for a line that already exists, and invented a directory page to hold it.

- **fix(ledger): split a full NFToken page before inserting** (`9a82325`, xrpl-validator) `page_insert` had NO capacity check: it located the page and inserted, so a full page silently grew to 33 tokens — past kDirMaxTokensPerPage. rippled splits first (NFTokenHelpers.cpp getPageForToken): the lower part moves to a NEW page keyed below, the rest stays, and the predecessor is relinked. That Created + Modified pair is exactly what mainnet emits.
- **fix(ledger): consolidate NFToken pages when a removal shrinks one** (`761df02`, xrpl-validator) `page_remove` handled an EMPTIED page (delete, relink neighbours) but did nothing when a page merely shrank. rippled consolidates on every removal (NFTokenHelpers.cpp removeToken): "The current page isn't empty. Update it and then try to consolidate pages. Note that this consolidation attempt may actually merge three pages into one!"
- **fix(ledger): tfOneAssetWithdrawAll empties the LP position** (`e12436b`, xrpl-validator) rippled's isWithdrawAll covers BOTH tfWithdrawAll (0x00020000) AND tfOneAssetWithdrawAll (0x00040000) — AMMWithdraw.cpp:1133-1138: if ((tx[sfFlags] & (tfWithdrawAll | tfOneAssetWithdrawAll)) != 0u) return WithdrawAll::Yes;
- **fix(ledger): remove the taker's own offer even when nothing crosses** (`70ea97e`, xrpl-validator) rippled deletes the taker's OWN offer off the tip of the book during offer crossing, and its commentary spells out why (BookStep.cpp:415-455): "We could skip over the self offer in the book and only cross offers that are not our own. This would make a lot of sense, but we don't do it. Part of the rationale is that we can only operate on the tip of the order book. We can't leave an offer behind -- it would sit on the …
- **fix(ledger): enforce lsfRequireAuth on the receiving trust line** (`a67eeca`, xrpl-validator) We never modelled lsfRequireAuth in the liquidity path at all — only in trust_set.rs for line-deletion decisions. rippled enforces it at STRAND CONSTRUCTION (DirectStep.cpp:430-437, DirectIPaymentStep::check): auto const authField = (src_ > dst_) ? lsfHighAuth : lsfLowAuth; if (sleSrc->isFlag(lsfRequireAuth) && !sleLine->isFlag(authField) && (*sleLine)[sfBalance] == beast::kZero) return terNO_AUTH;
- **fix(ledger): CredentialDelete needs only one of Subject/Issuer** (`aaf0c79`, xrpl-validator) Our preflight required BOTH Subject and Issuer. rippled requires at least ONE (CredentialDelete.cpp preflight: `if (!subject && !issuer) return temMALFORMED`) and resolves the pair in preclaim with
- **fix(ledger): funding outranks expiry in OfferCreate preclaim** (`5582a93`, xrpl-validator) rippled's OfferCreate::preclaim (:171) runs
- **fix(probe): hydrate the ISSUERS' owner directories for OfferCreate** (`e10fe45`, xrpl-validator) A crossing OfferCreate can hand the taker an IOU it has never held, creating a trust line that appends to BOTH sides' owner directories. The probe hydrated only the ACCOUNT's, never the issuers' — so for a real issuer, whose directory runs to thousands of pages, dir_insert could not see the existing directory and invented a fresh root where mainnet modified a tail page.
- **fix(ledger): a bridge leg with a pool but no book carries nothing** (`413368a`, xrpl-validator) All 8 cases were Flags=65536 exactly — tfPassive, buy side, IOU<->IOU with no XRP leg — so every one takes the auto-bridge path. That uniformity is what made the cluster tractable.
- **fix(ledger): pass the page hint when a payment tears down a trust line** (`95eb59c`, xrpl-validator) A line spent to zero mid-payment reverts to default and is deleted, which must remove it from BOTH owner directories. We called owner_dir_remove for both sides but passed None as the page hint, while TrustSet's trustDelete passes the real LowNode/HighNode (trust_set.rs:371-375).
- **fix(ledger): AMMWithdraw by LPTokenIn pays out both pool assets** (`e7b7d4d`, xrpl-validator) tfLPToken (0x00010000) withdrawals name only how many LPTokens to redeem and receive BOTH pool assets in

proportion — the transaction carries no Amount or Amount2 at all. Our apply path only ever moved Amount/Amount2, found neither, and so burned the LP tokens while paying out nothing. That is exactly why every case was missing the two RippleStates and the AccountRoot a payout touches.

- **feat(ledger): NFTokenMint carrying Amount also rests a sell offer** (`2488343`, xrpl-validator) featureNFTokenMintOffer: a mint with `Amount` mints the token AND rests a sell offer in one transaction. rippled factors this as `nft::tokenOfferCreateApply` and calls it from both NFTokenCreateOffer and NFTokenMint (NFTokenMint.cpp:312-330). We minted but never created the offer, losing exactly three mutations every time — the NFTokenOffer, its sell-offer directory page, and the owner directory entry. 11 cases in …
- **fix(ledger): OfferCreate reserve is pre-fee, and expiry precedes it** (`d753d7a`, xrpl-validator) Two mainnet singles, both from rMWVf1qJsgHgEd1Tuy378Zs53noKh4BujK.
- **fix(differential_probe): put the RPC server in the cache key** (`52a567d`, xrpl-validator) The dxcache is one directory shared by every probe run on the box, and they do not all talk to the same node. The nightly scout hydrates from our own the reference node (`runner.sh diff <seq> http://[host]`); re-probing an older find has to use s2, because the reference node's ~17k-ledger window rolled past it long ago. The key was method+params only, so one server's answers were served for the other server's question.
- **fix(xrpl-ledger): an AMM deposit must fund its XRP side after reserve** (`11a9c6c`, xrpl-validator) #105893158 85C32164 (7v1). We had only the reserve guard from 385e129, which asks whether the depositor clears its reserve at all. rippled additionally checks that the XRP side is FUNDABLE, and measures that against the reserve the depositor will owe AFTERWARDS: `xrpLiquid` is taken with the owner count bumped by one when there is no LPToken line yet, because the deposit is about to open one (AMMDeposit.cpp:230-244, …
- **feat(xrpl-ledger): token escrow, and give escrows their directory entries** (`5704d68`, xrpl-validator) #105823810 6AB38288 escrows 3750000 STSH. We rejected it temBAD_AMOUNT and applied nothing (0v6); mainnet built it in 7 nodes. This is the escrow lead the handoff has carried for weeks -- it finally has a fixture.
- **fix(xrpl-ledger): cap a direct IOU payment at what the destination can receive** (`cce3c8d`, xrpl-validator) rippled caps a payment's final issuer->dest step at `creditLimit(dst,issuer) - heldByDst`, floored at zero (DirectStepI::maxPaymentFlow, DirectStep.cpp:487), so a destination already at or over its own trust limit receives nothing and the strand is dry. `apply_path_payment` has carried that cap since 04a1586; that commit called the direct route the same rule "in principle" and left it alone for want of a failing …
- **fix(xrpl-ledger): finish CheckCreate's destination checks** (`edf4462`, xrpl-validator) Our CheckCreate preclaim stopped at "the destination exists". rippled's goes on to ask whether that destination will actually accept the check, and #105846674 F6CC9A594B17 is the case we were missing: a VRTY airdrop check to rnabZzjg, whose flags 0x120000 carry lsfRequireDestTag, sent with no DestinationTag. Mainnet claims the fee in one mutation; we created the Check and both directory entries in seven.
- **fix(xrpl-ledger): honour the NFT offer opt-out on Owner and Destination** (`8b23677`, xrpl-validator) An account can opt out of receiving NFT offers with `lsfDisallowIncomingNFTokenOffer` (0x04000000), and rippled's shared `tokenOfferCreatePreclaim` (NFTokenHelpers.cpp:824) honours that for BOTH accounts an offer names: a `Destination` must exist (tecNO_DST), and neither it nor the token's `Owner` may carry the flag -- either is tecNO_PERMISSION. We checked neither.
- **fix(xrpl-ledger): a frozen holder can fund nothing** (`1c46cda`, xrpl-validator) rippled reads spendable IOU through `accountHolds` with `fhZERO_IF_FROZEN`, so a holder whose line the issuer has frozen has NO funds at all, however large the balance. `isFrozen` (RippleStateHelpers.cpp:127) is the issuer's GLOBAL freeze, or the

ISSUER's side of the line -- `(issuer > account) ? lsfHighFreeze : lsfLowFreeze`. Our `available()` read the balance and nothing else, so a frozen holder could trade freely.

- **fix(xrpl-ledger): a bridged pass needs its book composition within the limit** (`625399c` , xrpl-validator) #105807256 84FD7DC8, the last divergence in the harness. A tfSell|tfPassive OfferCreate selling 3105.662739 BBRL for 607.478737 RLUSD: mainnet rests it in 4 nodes, we crossed 8 objects (12v4, all extra, nothing missing).
- **fix(xrpl-ledger): tick re-derivation divides with the STAmount rule** (`1edaa63` , xrpl-validator) #105777146 9BA91A9E sells 0.00059094 WETH for 1 XRP. The WETH issuer publishes TickSize 6, so the rate rounds up to 6 significant digits and the non-exact side is re-derived before placing. We derived TakerGets 0.000590939712330548 where mainnet stored 0.0005909397123305481 -- one ulp higher -- and that single ulp moved the rested offer to book level ...ABFB5801 where mainnet wrote ...ABFB5800. 4v4, the ledger's …
- **fix(xrpl-ledger): a crossing that exhausts the account rests no remainder** (`bb522bf` , xrpl-validator) "If offer crossing exhausted the account's funds don't create the offer" (OfferCreate.cpp:479-484). This is the companion to the pre-crossing `accountFunds` clamp from 1de6d87: that one bounds what may be SPENT, this one bounds what may REST.
- **fix(xrpl-ledger): carry the trailing reap across book levels** (`ba73d4f` , xrpl-validator) The trailing step added in 130c246 stopped at the end of the page chain of the level it had been crossing on. rippled's stream spans the whole BOOK: `OfferStream::step` carries no quality test at all, so after a consumed offer it keeps advancing — and reaping — across quality levels until it reaches a LIVE offer, and only then does `execOffer` 's `checkQualityThreshold` return false and end the walk …
- **fix(xrpl-ledger): step past a satisfied fill, and reap dust-backed offers** (`130c246` , xrpl-validator) Two more of `OfferStream::step` 's removal semantics, both needed to close #105778999 6B2A11B3 (5v15, missing 10, extra 0) -- a circular self-pay, SendMax 140 XRP into POSAA, tfPartialPayment.
- **fix(xrpl-ledger): reap a book level's dead offers before consulting the pool** (`01f09ba` , xrpl-validator) rippled steps the offer stream BEFORE it asks the AMM, and every dead offer stepped past is removed whether or not anything crossed: if (offers.step()) // BookStep.cpp:835 if (tryAMM(offers.tip().quality())) // anchor = first LIVE offer do { ... } while (offers.step()); else tryAMM(std::nullopt); // exhausted -> maxOffer return {offers.permToRemove(), ...}; // BookStep.cpp:852
- **fix(clawback): decode the base58 holder from Amount.issuer** (`f6ed033` , xrpl-validator) Clawback resolves the token holder from the nested Amount.issuer field, but misc.rs::decode_account_id was hex-only. The probe hex-normalises only top-level ACCOUNT_FIELDS, never a nested amount object, so Amount.issuer arrives as a base58 r-address -- decoding it hex-only returned None and the transactor rejected a valid clawback as Malformed. A spurious reject is consensus-relevant: we would drop a tx mainnet …
- **fix(nftoken): decode the base58 Issuer field on authorised-minter mints** (`881e160` , xrpl-validator) NFTokenMint's decode_account_id was hex-only, but the probe does not hex-normalise the Issuer field (it is absent from ACCOUNT_FIELDS), so an authorised-minter mint's base58 Issuer silently failed to decode and fell back to tx.account -- the minter. One wrong account cascaded two ways: MintedNFTokens was credited to the minter instead of the issuer, and the NFTokenID embedded the minter, so the token's low-96 -- …
- **fix(differential_probe): hydrate the issuer's owner-dir tail for CheckCash** (`7eb0dca` , xrpl-validator) CheckCash creates the delivered IOU's trust line, which the ISSUER co-owns -- but native_read_keys loaded only the casher's owner-dir root, so an issuer with a multi-page directory was never hydrated and dir_insert invented a fresh root instead of appending to the existing last page.

- **fix(xrpl-ledger): implement AMMWithdraw tfWithdrawAll teardown** (`a7bd6a0`, xrpl-validator) tfWithdrawAll fell through the partial-withdraw path: it withdrew NO assets (no Amount fields to loop over) and burned a fixed default LPToken amount, leaving the LPToken trust line Modified-at-zero instead of torn down.
- **fix(xrpl-ledger): honour tfPassive -- don't consume equal-quality makers** (`77f6f39`, xrpl-validator) We never read tfPassive: a passive offer was crossed like a normal one. A passive offer crosses only STRICTLY better makers and rests behind equal-quality ones (rippled OfferCreate.cpp:396 `++threshold`). Our rate encoding is inverted (lower = better, monotone in the u64), so tighten the threshold by one ULP for passive offers; the existing q<=threshold and maker-rate gates then exclude the equal level.
- **fix(xrpl-ledger): re-check a maker's actual quality, not just its book page** (`7e592e9`, xrpl-validator) rippled compares a crossing maker's ACTUAL getRate to the taker's limit, not merely the quantized book-directory level it rests in. An offer can sit in a page that ties the threshold while its exact rate is one ULP worse, and rippled leaves such an offer untouched.
- **fix(xrpl-ledger): cross an underfunded maker at book quality, don't rest** (`84898d4`, xrpl-validator) The section-1 achieved-quality break (offer.rs) was calibrated for the #105780948 IoC tecKILLED, where the TAKER's own side bounds the fill and the floored output realises worse than the limit. It also fired, wrongly, on a plain offer crossing a maker that is merely UNDERFUNDED at a book quality equal to the taker's limit: the <=1e-7 round-up on `pay` for the small maker-funds-clamped fill tips the achieved rate …
- **fix(xrpl-ledger): cap payment delivery at the destination's trust limit** (`04a1586`, xrpl-validator) The last TER-class divergence cluster (6: 105740164/105741244/105741859, 2 each) was not the two-hop AMM strand bug the handoff suspected. rippled's final delivery step DirectStepI::maxPaymentFlow (DirectStep.cpp:487) limits what a payment can land on the destination to creditLimit(dst,issuer) minus what it already holds, so a destination at or over its own trust limit receives nothing and the whole flow is …
- **fix(xrpl-ledger): honour keepRoot when a directory page empties** (`34fca11`, xrpl-validator) dir_remove always deleted an emptied root page -- rippled's keepRoot=false behaviour -- with no way to ask for anything else. Most owner-directory removals pass true, so we emitted the page as Deleted (:2) where mainnet emits it Modified (:1).
- **fix(xrpl-ledger): CheckCancel unlinks the Check from both owner directories** (`b79f40f`, xrpl-validator) A Check is linked into TWO owner directories -- the writer's via sfOwnerNode and the destination's via sfDestinationNode. CheckCreate inserts both (check.rs) and CheckCash removes both, but CheckCancel removed neither: it deleted the object and adjusted the reserve, leaving two dangling directory entries.
- **fix(xrpl-ledger): OfferCreate crossing spends only accountFunds, not TakerGets** (`1de6d87`, xrpl-validator) rippled clamps the crossing input to the taker's actual funds -- "Don't send more than our balance", OfferCreate.cpp:399-401, where inStartBalance = accountFunds(psb, accountID_, takerAmount.in, ...) is the XRP balance minus reserve. TakerGets bounds what may REST, never what may be spent. We clamped only at TakerGets, so an underfunded offer crossed with money the account did not have.
- **fix(xrpl-ledger): a Payment to a pseudo-account is tecNO_PERMISSION** (`3a718aa`, xrpl-validator) An AMM, Vault, or LoanBroker account receives value only through its own transaction type — never an ordinary Payment. rippled rejects it with tecNO_PERMISSION (Payment.cpp:635, isPseudoAccount(sleDst)), where a pseudo-account is any AccountRoot carrying a designator field: sfAMMID, sfVaultID, or sfLoanBrokerID. The engine had no such check and delivered.
- **fix(xrpl-ledger): CheckCash requires exactly one of Amount / DeliverMin** (`609c827`, xrpl-validator) Preflight required Amount, so it rejected every DeliverMin cash-out as temMALFORMED — a valid transaction the

network accepts, which is a consensus-relevant divergence (we'd drop a tx mainnet applies). rippled's rule is an XOR: bool(Amount) == bool(DeliverMin) => temMALFORMED (CheckCash.cpp:57). Amount is a fixed cash-out; DeliverMin a floor for a partial one.

- **fix(xrpl-ledger): reject offers by achieved quality and skip expired ones; keep the cleanup on tecKILLED** (`a823d98`, xrpl-validator) Three faults in book crossing, uncovered together on two IoC offers that mainnet leaves completely untouched.
- **feat(xrpl-ledger): DX_BOOK trace for the book walk's quality gate** (`eb19a38`, xrpl-validator) Prints each directory's encoded quality against the taker's threshold at the point the walk decides to break, in the same style as DX_AMM and DX_BRIDGE. The crossing gate is a 64-bit encoded-rate comparison where a single ulp decides whether an offer is reachable, and there was no way to see either side of it without a rebuild.
- **fix(xrpl-ledger): tecOBJECT_NOT_FOUND for missing NFT offers, tecAMM_BALANCE for over-withdraw** (`ce27e48`, xrpl-validator) Two unrelated result-code gaps, both fee-only on mainnet.
- **fix(xrpl-ledger): correct the credential keylet, allow self-issuance, hydrate it** (`08515b3`, xrpl-validator) Four faults stacked on one transaction, each hiding the next.
- **fix(xrpl-ledger): merging past an oracle's ten-entry cap is tecARRAY_TOO_LARGE** (`bfc83f9`, xrpl-validator) OracleSet is an upsert. Overflowing kMaxOracleDataSeries by MERGING the transaction's series into the existing object is a tec, not a tem: the transaction is well formed and only the resulting object is too big, so the fee is claimed (OracleSet.cpp:168). temARRAY_TOO_LARGE is a separate preflight check on the transaction's own array (line 46), which is not what these hit.
- **fix(xrpl-ledger): AccountDelete fee is one owner reserve, read from the ledger** (`3cebd6a`, xrpl-validator) AccountDelete::calculateBaseFee returns calculateOwnerReserveFee(view, tx) — "the fee required for AccountDelete is one owner reserve". That comes from the ledger's fee settings and is not a constant: the 2024 vote cut the increment from 2 XRP to 0.2, so a hardcoded 2_000_000 rejects every present-day AccountDelete.
- **fix(xrpl-ledger): charge the issuer's TransferRate on payment delivery** (`2b1beae`, xrpl-validator) The engine ignored TransferRate entirely, so every payment that moved an IOU between two non-issuers delivered the gross amount. rippled charges the issuer's rate on the strand's last step: DirectStepI issues to the destination and qualitiesSrcIssues sets srcQOut = transferRate(issuer) whenever the previous step redeems (DirectStep.cpp:765), which for a payment is always — BookStep reports DebtDirection::Redeems …
- **fix(xrpl-ledger): a payment cannot open the destination's trust line** (`e27d088`, xrpl-validator) Every payment strand ends by rippling the delivered IOU from its issuer to the destination, and that final step is a DirectStepI whose check opens with "Since this is a payment a trust line must be present" — no line yields terNO_LINE (DirectStep.cpp:423). Because every strand shares that same last step, one missing line invalidates all of them, and a flow with no surviving strands is tecPATH_DRY.
- **fix(xrpl-ledger): no AMM liquidity in permissioned-domain books — corpus 100%** (`84ced29`, xrpl-validator) BookStep::tryAMM returns early when book_.domain is set ("amm doesn't support domain yet", BookStep.cpp:820), so a pool never participates in a domain-scoped book. cross_engine_to discovered the AMM regardless of domain, letting a domain offer cross a pool that rippled does not admit.
- **fix(xrpl-ledger): payments never autobridge — AMM over-mutation via a synthesized XRP leg** (`4a36c48`, xrpl-validator) rippled synthesizes the XRP bridge only in FlowCross (offer crossing). A payment's strands come from its own Paths plus the default path, so it reaches a book only where its path names one. cross_engine_to bridged unconditionally for IOU<->IOU, inventing a route the transaction never asked for.

- **fix(xrpl-ledger): direct IOU payment requires an existing destination trust line** (`a6ef95a`, xrpl-validator) A Payment delivers an IOU by rippling through the issuer, which credits the destination's EXISTING trust line — rippled never opens a trust line for the receiver. Our apply_iou_direct phantom-created the destination's line and delivered, returning tesSUCCESS (with extra RippleState + owner-dir + dir-page mutations) where mainnet returned tecPATH_DRY (fee-only), because the destination did not trust the issuer.
- **fix(xrpl-ledger): AMMDeposit owner-reserve guard for zero-LPToken depositors** (`385e129`, xrpl-validator) Same owner-reserve class as the TicketCreate/TrustSet fix: an AMMDeposit by an account holding ZERO LPTokens opens (or funds) an LPToken trust line and so must keep XRP above accountReserve(ownerCount + 1). The native engine skipped this and over-applied (tesSUCCESS, 4-5 muts) where mainnet returned tecINSUF_RESERVE_LINE (net_muts=1).
- **fix(xrpl-ledger): enforce owner reserve on object creation — TicketCreate + TrustSet** (`bcf7e5c`, xrpl-validator) The native engine minted owned objects without checking the account could afford the incremental owner reserve, returning tesSUCCESS where mainnet returned tecINSUFFICIENT_RESERVE (TicketCreate) / tecINSUF_RESERVE_LINE (TrustSet). Closes ~22 fresh-traffic scout divergences in one class fix.
- **fix(xrpl-ledger): NFTokenCreateOffer token-existence preclaim + sandbox create-then-delete nets to nothing — 2 fresh-traffic finds** (`0a4d4f5`, xrpl-validator) Two shadow finds from the first hour of hourly scouting: NFTokenCreateOffer preclaim now walks the token owner's pages (sell→ Account, buy→sfOwner) and returns tecNO_ENTRY when the token is absent, per rippled NFTokenCreateOffer::preclaim findToken. Was accepting stale buy offers for burned/moved tokens (#105757083 1B7B0C8A). Probe preloads the owner's NFT pages for NFTokenCreateOffer.
- **feat(xrpl-ledger): per-leg AMM liquidity in bridged crossing — CORPUS 100% (1109/1109)** (`c333d93`, xrpl-validator) Each bridge leg is a BookStep of its own pair, so its book head competes with that pair's pool via multi-path FIB slices — mainnet filled A8830CA4's XAH leg from the XAH/XRP pool while its RLUSD leg crossed the book, and BE7884AA's missing partial fill was the same arbitration. Leg sources resolve independently (book offer or pool slice), the XRP slice flows through whichever pair wins, and pool legs advance their …
- **feat(xrpl-ledger): multi-path FIB AMM offers in bridged crossing — corpus stable 1107/1109** (`f2d2bcb`, xrpl-validator) IOU↔IOU crossings are always two strands on mainnet, so the direct-pair pool competes as rippled's generateFibSeqOffer: CLOB-like slices sized 0.025% of the pool's starting balances scaled by the Fibonacci sequence, judged by the slice's AVERAGE quality (spot+slippage+fee). Stops the pool from beating books it loses to by razor margins (A8830CA4 no longer touches the XAH/RLUSD pool). No corpus regressions.
- **feat(xrpl-ledger): issuer account-hops, endpoint dedup, in-flight hygiene — all corpus payments match — corpus 99.8%** (`020c568`, xrpl-validator) Path account elements through the preceding hop's ISSUER are no-op re-anchors — accepted and skipped (true third-party rippling still unsupported). Endpoint currencies named as hops collapse via chain dedup. In-flight intermediates now leave NO trace: the sender's hop lines are restored byte-exact (Sandbox::forget for never-existed lines) and a mid-chain line-creation's directory droppings (both owners' roots + last …
- **feat(xrpl-ledger): rippled QualityFunction limit-trim for AMM fills — corpus 99.5%** (`96dcd62`, xrpl-validator) Ported the exact single-path offer-crossing pipeline from rippled 3.2.0 (StrandFlow limitOut + BookStep post-check): when the AMM fill would beat the taker limit, the OUT request is trimmed via the pool QualityFunction (out = (1/q − b)/m under global Upward rounding, m/b at Near), re-swapped, and the ACHIEVED quality is re-checked with a 1e-7 relative tolerance granted only to trimmed requests. Directed roundings …

- **fix(xrpl-ledger): me_muldiv 16-digit quotient scaling; AMM fee-adjusted spot; AMM turn in bridged crossing — corpus 99.3%** (`7d51d97`, xrpl-validator) me_muldiv truncated to ZERO when the denominator mantissa dwarfed the numerator (XRP drops x IOU 1e-11 mantissas) — the bridge slice sizing died on it; the quotient now keeps ~16 significant digits. AMM spot quality embeds the trading fee (rate = in / (out·(1−f))) and the direct-pair pool competes inside cross_bridged, anchored to the best book rate. DX_BRIDGE/DX_AMM env diagnostics stay in. 105663160 replays 65/65; …
- **feat(xrpl-ledger): XRP autobridging for IOU↔IOU crossing; sender-reserve funding check — corpus 99.2%** (`7111b1f`, xrpl-validator) cross_bridged interleaves the direct book with the two-book XRP bridge (rippled FlowCross): peek both sources' head rates, consume one offer or bridge slice from the better one within the taker threshold; the XRP intermediate rides through the taker and nets out of the mutation set. live_head only condemns unfunded offers whose backing state is actually loaded (phantom deletions poisoned attempt 1) and never mutates …
- **feat(xrpl-ledger): full AMM lifecycle parity — Create/Deposit/Withdraw on real legs — corpus 99.1%** (`a146364`, xrpl-validator) AMMCreate derives the pool account the rippled way (ripesha over sha512half(prefix0 ‖ parentHash ‖ ammKeylet), parent hash now threaded from the fixture header), creates the AMM AccountRoot + funds both legs via move_leg + mints creator LP tokens. Deposit/Withdraw move real legs between depositor and pool account and mint/burn the LP-token line (currency 0x03 ++ SHA512(minCur ‖ maxCur)[0..19], mainnet-verified). …
- **feat(xrpl-ledger): Number-exact rounding, XLS-80 domain books, multi-hop payment strands, real reserve — corpus 98.8%** (`13197e6`, xrpl-validator) st_divide/st_multiply now round half-even folding the exact division remainder (the legacy +5/+7 truncation fudges double-rounded against the new nearest pass: 0EAE58BB fixed both ways, 42071037 proved the fudge had to go). DomainID (permissioned DEX) hashes into the book base for crossing AND placement — 105666804 replays 62/62. Payments execute multi-hop strands from the first path (chained book crossings, …
- **feat(xrpl-ledger): real NFTokenPage model — mint/burn/accept/cancel/modify on structural page keys — corpus 98.2%** (`454d6c6`, xrpl-validator) New ledger::nftpage: page key = owner(20) ++ low-96 bound, max page anchor, chain walk via PreviousPageMin, sorted insert, empty-page delete + relink. NFTokenMint composes the real NFTokenID (flags‖fee‖issuer‖taxon^scramble‖seq off FirstNFTokenSequence+MintedNFTokens); AcceptOffer takes offer INDEXES (direct + brokered), moves the token between page sets, pays XRP with the id-embedded transfer fee, and clears offer …
- **feat(xrpl-ledger): real TicketCreate + OracleSet/OracleDelete transactors; tecDST_TAG_NEEDED — corpus 97.5%** (`d28de50`, xrpl-validator) TicketCreate: batch ticket creation off tx seq (rippled CreateTicket.cpp shape), owner-dir spill via shared dir_insert, TicketCount/OwnerCount and Sequence landing past the batch. OracleSet: XLS-47 upsert with pair-level series merge and 1/2-unit reserve; new oracle keylet (0x0052 'R', mainnet-verified). Payment preclaim gains the lsfRequireDestTag check. Closes all 4 TicketCreate + 2 OracleSet SKIP-STUBs and the …
- **feat(node): differential_probe RPC disk cache — immutable historical lookups, DX_CACHE override** (`a585ce8`, xrpl-validator)
- **fix(xrpl-ledger): faithful OfferCreate preclaim funding — tecUNFUNDED_OFFER — corpus 96.8%** (`5b1d386`, xrpl-validator) OfferCreate::preclaim returned the generic TxResult::Unfunded (tecUNFUNDED) and rejected whenever balance < the FULL sell amount. Both are wrong: rippled unfunds only when accountFunds(TakerGets) <= 0 (for XRP: balance minus reserve — partially funded offers still cross) and the code is tecUNFUNDED_OFFER. The old check was also XRP-only.

- **fix(xrpl-ledger): sell-side offer funding check — tecUNFUNDED_OFFER — corpus 96.8%** (`870eefd`, xrpl-validator) An OfferCreate can only sell what the account actually holds of the TakerGets asset. Our crossing engine checked the MAKER funding but never the taker: after the tfSell fix started crossing the full TakerGets, five arb offers from one account selling IOUs it holds NONE of (CLARITY, XALPHA) crossed and succeeded, where mainnet returns tecUNFUNDED_OFFER fee-only. Verified: the account CLARITY line was absent at seq-1.
- **feat(xrpl-ledger): tfSell crossing semantics — sell the whole TakerGets — corpus 96.3%** (`3a3f337`, xrpl-validator) A tfSell offer sells its ENTIRE TakerGets even if that acquires more than TakerPays; TakerPays is only a minimum. Our crossing engine capped each fill at rem_pays (the wanted amount) and terminated the walk once it was reached, so a tfSell that could fully sell only by taking the surplus was left with an unsold remainder — and a FillOrKill/ImmediateOrCancel sell was then wrongly killed. Mainnet tx 2042F8CE / …
- **fix(xrpl-ledger): trust-line lifecycle — receiver-only reserve, NoRipple, zero-balance deletion — corpus 95.6%** (`d547205`, xrpl-validator) Three faithful-port fixes in line_adjust, from rippled rippleCreditIOU / trustCreate: - trustCreate charges the reserve to the RECEIVER only. We bumped BOTH parties' OwnerCount, so the issuer accrued phantom reserves. The line still joins both owner directories; only one OwnerCount moves. - New lines get NoRipple on the receiver's side unless their account has DefaultRipple. This flag is also part of the deletion …
- **fix(xrpl-ledger): route strand output to the destination — corpus 95.6%** (`bb1eefa`, xrpl-validator) A cross-currency Payment credited the acquired asset to the SENDER and then forwarded it to the destination. rippled delivers the strand's output straight to the destination: routing through the sender materializes an intermediate trust line it never creates — and when the destination IS the issuer (mainnet tx AAA6EB389D3A: RIBBLE paid to rG7jT6D4, its own issuer), the IOU is redeemed at the maker/AMM line rather …
- **fix(xrpl-ledger): issuer TickSize in offer placement — corpus 95.0%** (`a5db381`, xrpl-validator) OfferCreate ignored the issuer-published TickSize. rippled rounds the requested rate UP to N significant digits (Quality::round) and re-derives the non-exact side — TakerPays for tfSell, TakerGets otherwise — BEFORE crossing, so both the crossing and the placed remainder use the adjusted amounts. Mainnet tx 9870DA80 asked to sell 8539920 drops for STX (issuer TickSize 6) and rippled stored 8539914 with no …
- **feat(xrpl-ledger): AMM swap engine — corpus 94.1%, the third summit** (`18d4a00`, xrpl-validator) New amm_swap module: faithful port of rippled AMMHelpers under fixAMMv1_1/v1_2. A 16-significant-digit decimal Number core with per-op directed rounding (correctly rounded mul/div/add/sub/sqrt), swapAssetIn/ swapAssetOut with the amendment's AMM-favoring rounding sequence, spot- quality gating vs the book (strictly-better + 1e-7 relative threshold), book-anchored sizing via changeSpotPriceQuality (citardauq …
- **fix(xrpl-ledger): path payments — quality gate only under tfLimitQuality, DeliverMin floor, book pre-state — corpus 90.3%** (`28f0cb6`, xrpl-validator) Two root causes behind the 62 tecPATH_DRY divergences: - Engine: apply_path_payment imposed the SendMax/Amount ratio as a per-offer quality bound unconditionally. rippled only does that under tfLimitQuality; arb-style conversions use a sentinel-max Amount whose implied ratio reads every book as dry. Threshold is now unlimited without the flag (aggregate SendMax/Amount bounds still hold), and DeliverMin is enforced …
- **feat(xrpl-ledger): CheckCash via transfer engine + tec classification — corpus 90%** (`02508d9`, xrpl-validator)
- CheckCash rides the shared engine: SendMax fixes the currency, writer shortfall (or over-asking) fails the rippled way (tecPATH_PARTIAL, fee-only), success moves the leg + deletes the check + unlinks BOTH owner

directories (OwnerNode/DestinationNode hints) + OwnerCounts. CheckCash 0/30 -> 30/30. - probe read-set loads the CheckID object (a fee-only mainnet meta never contains it -> native said tecNO_ENTRY where …

- **feat(xrpl-ledger): CheckCash via shared transfer engine — IOU checks + tecPATH_PARTIAL semantics** (`a4dc8d7`, xrpl-validator) CheckCash now routes through the offer.rs transfer helpers (leg_of/available/move_leg) instead of hand-rolled XRP-drops balance edits: IOU checks cash over trust lines, issuer self-cover is unlimited, and writer shortfall fails the rippled way (tecPATH_PARTIAL, fee-only) instead of tecUNFUNDED. Check deletion now unlinks BOTH owner directories (OwnerNode + DestinationNode hints) and decrements both owner counts. …
- **feat(xrpl-ledger): IOU + cross-currency payment engine — second summit** (`e6efe32`, xrpl-validator) Payment was XRP-only (preflight returned tecUNSUPPORTED for IOU; preclaim demanded an XRP balance even for cross-currency payments BUYING XRP). Segmentation showed the corpus is dominated by arb-probe partial payments (XRP-deliver, IOU SendMax, tfPartialPayment) that mainnet fails tecPATH_DRY fee-only — natives just needed to attempt the path and agree.
- **fix(xrpl-ledger): cancel-and-replace + funded-check starvation — OfferCreate 64%** (`f5b87b2`, xrpl-validator) Two data-diagnosed fixes to the crossing engine's first corpus run: - OfferSequence on OfferCreate cancels the named prior offer BEFORE crossing (rippled cancel-and-replace; the '126 crossing misses' were the taker's own old offers — replaced, not crossed) - differential read-set loads the taker's gets-side trust line: a pure placement never has it in mainnet meta, so available() starved and threw 220 false …
- **feat(xrpl-ledger): integer offer-crossing engine — the summit assault** (`7ee6dcd`, xrpl-validator) Replaces the f64 crossing stub with a real integer engine: - SHAMap::keys_with_prefix (nibble-radix descent) + Sandbox merged view — native book enumeration: walk a book's quality dirs ascending from best quality, stop past the taker's threshold (swapped-args offer_quality) - (mantissa u128, exponent i32) arithmetic with directed rounding at fill boundaries (taker pays UP, receives DOWN — Quality::ceil_in/out …
- **feat(xrpl-ledger): order-book quality keylet + OfferCreate placement — base camp** (`150c432`, xrpl-validator) The book quality directory key was the last missing keylet family: - book_base = SHA512Half(0x0042 'B' + pays_cur + gets_cur + pays_iss + gets_iss); quality dir = base[0..24] + quality_be64 - offer_quality mirrors rippled getRate under the STNumber switchover: normalize both mantissas to [1e15,1e16), truncating muldiv at 10^17, +5, then ONE round-half-even pass over the excess tail (Number canonicalize). Locked …
- **feat(xrpl-ledger): ticket consumption in apply_common — OfferCancel 19/19** (`ad0f628`, xrpl-validator) The '16 OfferCancel stragglers' were not OfferCancel bugs: every one was a TICKETED transaction. rippled's SeqProxy consumption deletes the Ticket object, unlinks it from the owner directory, and decrements OwnerCount + TicketCount — native's apply_common only skipped the Sequence increment. Root-caused from real meta (AccountRoot diff {Balance, OwnerCount, TicketCount} + Ticket DeletedNode); ticket keylet …
- **feat(xrpl-ledger): CheckCreate + NFTokenCreateOffer parity — 5 fully-green types** (`e93b4b3`, xrpl-validator)
- keylet: nft_offer_key (0x0071 'q'), nft_buy_offers_key (0x0068 'h'), nft_sell_offers_key (0x0069 'i') — all three mainnet-verified byte-for-byte against #105666725 before implementation - nftoken: NFT offers were keyed in the DEX offer space (0x006F) — every created offer landed on a provably wrong key. One-helper fix keeps accept/cancel consistent. CreateOffer now inserts into the creator's owner dir AND the …
- **feat(xrpl-ledger): OfferCancel directory unlinking — 6/6 MATCH across two ledgers** (`270345a`, xrpl-validator)

- directory: generalize dir_remove(root_key, ...) so order-book quality dirs share the owner-dir page mechanics; owner_dir_remove is now a wrapper. Hint path no longer requires the root page loaded (book hints often ARE the root). Empty-root cascade: deleting the only non-root page kills the whole directory when the root holds no entries (rippled behavior). - directory: hex-case normalization — mainnet-loaded …
- **feat(xrpl-ledger): trust-line deletion + oracle state threading — TrustSet 14/14 MATCH** (`87d6ff7`, xrpl-validator)
- trust_set: rippled-faithful default-line deletion (per-side interest test: limit/balance/quality/freeze/auth/NoRipple-vs-DefaultRipple), tf-flag application (tfSet/ClearNoRipple, tfSet/ClearFreeze) before the test, creation flags (creator reserve bit + auto-NoRipple), both-roots OwnerCount touch at delete mirroring create - directory: hint-based owner_dir_remove (rippled's no-walk LowNode/HighNode design) with …
- **feat: multi-page owner directory + load native-read keys — TrustSet 1->10 MATCH** (`a22af92`, xrpl-validator) Two increments that together get trust-line creates to byte-for-key parity: - directory.rs: owner_dir_insert now walks the page chain (root.IndexPrevious -> last page), appending to the last page or splitting to a new dir_page_key page on overflow — so native touches the SAME directory page mainnet does (large gateway issuers keep trust lines on non-root pages). - differential_probe: native_read_keys loads the …
- **feat(ledger): owner-directory bookkeeping (single root page) + wire into TrustSet** (`274d420`, xrpl-validator) New crate::ledger::directory: owner_dir_insert / owner_dir_remove maintain an account's owner directory (the DirectoryNode listing objects it owns). Shared infrastructure for every object-creating transactor. TrustSet now inserts a new RippleState into BOTH parties' directories (owner_dir_insert), so native emits the DirectoryNode mutations mainnet does — at the right key + kind (the gate compares key/kind sets, so …
- **fix(ledger): NFTokenAcceptOffer reads offer ref as hex ledger-index, not {Account,Sequence}** (`31735dc`, xrpl-validator) NFTokenSellOffer/BuyOffer is the offer object's 32-byte hex ledger index; the native code treated it as an {Account,Sequence} pair and failed to Malformed before ever reading the offer. Now parses the hex index and takes the owner from the loaded offer object. Genuine bug fix; the transactor still has further naive parses (NFTokenID-as-object) + needs NFT-page transfer logic to green — noted, not chased here. …
- **feat(node): differential_probe loads pre-state objects (not just AccountRoots)** (`330ed4d`, xrpl-validator) Native was starved of pre-state — only AccountRoots were loaded, so it phantom-created every RippleState/Offer/Check/AMM object it referenced, inflating the whole conformance map. Now loads each tx's Modified/Deleted affected-nodes at seq-1 (transcoded to native's account-hex convention), so native SEES the objects it operates on. TrustSet lines now modify instead of phantom-create; the residual misses are genuine …
- **fix(ledger): TrustSet decodes base58 issuer (was hex-only → every real tx temMALFORMED)** (`fdca115`, xrpl-validator) extract_limit_amount decoded the LimitAmount issuer with hex::decode, but mainnet JSON carries it as a base58 classic address — so every real TrustSet failed to Malformed before applying. Add decode_issuer (hex OR base58 via the canonical xrpl_core AccountId::from_address). Differential: TrustSet DIVERGE-TER 16->0 (all now tesSUCCESS matching mainnet, 1 full MATCH; the remaining 15 are DIVERGE-MUT — owner-directory …
- **fix(node): differential_probe --json emits only JSON (SUMMARY to stderr); re-mint sample fixtures with tx_json** (`9cfb9af`, xrpl-validator)
- **feat(node): differential_probe — measure native engine vs mainnet parity** (`c862c37`, xrpl-validator) Replays each fixture tx through the native xrpl_ledger transactors and compares (TER, mutation-key-set) to mainnet — the instrument for the fully-Rust roadmap. Fixture generator now emits tx_json + tx_order for the native leg.

- **feat(node): network-parameterized replay — NetParams for testnet/devnet parity probes** (`8ed5545`, xrpl-validator) apply_ledger_in_order_with_net carries network_id/base_fee/reserves (mainnet wrapper keeps every existing caller unchanged); fixtures capture the params from server_state; parity_probe replays under the fixture's network rules.
- **feat(node): parity_probe bin — runtime fixture replay for the scout loop** (`52e9df5`, xrpl-validator) Loads blobs+expected fixture files by path (no rebuild per ledger) and reports the standard parity block. Exit 0 clean / 1 divergent / 2 fixture error.
- **fix(node): era-guard FFI verify + never keep unverifiable the validator's ledger feed writes** (`23a76a8`, xrpl-validator) 2026-07-15 #105612802: during a the reference node RPC flap, process_ledger committed the write batch, then found account_hash empty (its fetch had failed), skipped the whole verify block and fell through to false — the validator's ledger feed held position with the write already in state.rocks. The re-drive then replayed the ledger onto its own effects: the FFI verify lane produced 43 tefPAST_SEQ + 10 tefBAD_LEDGER false divergences (dashboard …
- **fix(node): hold the validator's ledger feed position on unapplied ledger instead of skipping** (`5ea6c9e`, xrpl-validator) All three batch failure paths (metadata unavailable, tx-gate ENFORCE incomplete, process_ledger==false: aborted fetch / DB write failure / rolled-back MISMATCH) previously advanced last_processed past the failed ledger. A skipped delta permanently diverges state.rocks, so every later account_hash mismatches and halt-on-mismatch fires 3 ledgers later. 2026-07-10 halt: #105500328 aborted during the the reference node outage, was …
- **feat(xrpl-node): Stage 4 Phase A — native-engine shadow leg (XRPL_NATIVE_SHADOW=1)** (`2d66eb0`, xrpl-validator) The native Rust transaction engine now runs beside the FFI (libxrpl C++) leg on every live ledger, dormant until armed.
- **fix(xrpl-node): shadow leg stamps threading — first-light lesson** (`02465de`, xrpl-validator) #106628655, the first ledger the native engine ever shadowed live: 175 byte diffs, 5 missing keys, ZERO TER mismatches — the exact signature of PreviousTxnID/PreviousTxnLgrSeq never being stamped. The replay applies stamp_threading after every tx; the shadow loop now does the identical call. The mirror's canonical reconciliation did its job: nothing compounded.
- **feat(xrpl-node): shadow receipts name their classes — typed missing keys, stale-mirror audits, reconcile-leak verifier** (`fcb7b3a`, xrpl-validator) Typed missing keys (decode the FFI bytes for LedgerEntryType — the first histogram read 'deleted'x41, the fingerprint of a deletion leak). TER mismatches audit the mirror against the meta's own PreviousFields and print which field of which class went stale (first catch: AccountRoot.OwnerCount mirror=4 truth=3, staleness born ledgers before the symptom). Post-reconcile verifier re-reads every overlay key and …
- **fix(xrpl-ledger): funds-exhausting fill sizes from the gross-cap chain, not the rem_gets accumulator** (`032f9c3`, xrpl-validator) Finding 30, first blood of the Stage 4 live shadow (#106629200 9264210055, OfferCreate RLUSD->XRP, five fills, unrated, underfunded): slices 1-4 byte-identical; the funds-exhausting slice 5 paid the me_sub chain's remainder (…443496) where rippled pays the stored line's remainder (…443500) — the maker's owed line must close to EXACT ZERO and ours landed -4e-15. The rem_gets me_sub chain and the line's STAmount adds …
- **fix(xrpl-ledger): funds-exhausting fill sizes from the gross-cap chain, not the rem_gets accumulator** (`c53b5af`, xrpl-validator) Finding 30, first blood of the Stage 4 live shadow (#106629200 9264210055, OfferCreate RLUSD->XRP, five fills, unrated, underfunded): slices 1-4 byte-identical; the funds-exhausting slice 5 paid the me_sub chain's remainder (…443496) where rippled pays the stored line's remainder (…443500) — the

maker's owed line must close to EXACT ZERO and ours landed -4e-15. The rem_gets me_sub chain and the line's STAmount adds …

- **fix(xrpl-ledger): equal-withdraw fraction ceils, asset products floor** (`bf4a729` , xrpl-validator) Findings 31+32 — one rule pinned from both sides of a single tfWithdrawAll (#106629211 7ED17A0F, ARMY/DROP two-IOU pool): the DROP payout demanded a larger result than frac-nearest-then-floor gives, the ARMY payout a smaller one than any product-up gives, and the unique satisfying pair is st_divide_up (exact 16-digit ceil, new helper) for the fraction with mul_directed floor for both products. The dust calibrator …
- **fix(xrpl-ledger): AMMVote — default-zero omission and AuctionSlot DiscountedFee** (`0ac8d7e` , xrpl-validator) Finding 33, two gaps in the two-day-old applyVote port, one specimen (#106629215 AC9BA657): (a) a VoteEntry voting fee ZERO serializes WITHOUT its TradingFee (SoeDefault omission — ours was 3 bytes long per zero-fee entry), same rule applied to the AMM root TradingFee; (b) the AuctionSlot's DiscountedFee follows every vote — fee/10, set when nonzero, REMOVED when zero (AMMVote.cpp:208-218) — ours left the stale …
- **feat(xrpl-node): shadow dumps the engine's-eye tx on first per-ledger TER mismatch** (`d57e19b` , xrpl-validator) Defect B (live-only TER storms the offline replay refutes): the first mismatching tx per ledger now logs its parsed fields exactly as build_txfields delivered them — if the live inputs differ from the offline world's in any byte, the receipt names it; if they match, the divergence is environmental to the process and the dump proves that.
- **fix(xrpl-ledger): equal-withdraw fraction ceil gates on fixAMMv1_3** (`c26156a` , xrpl-validator) The census caught the over-rotation: #105880685 (pre-amendment) lands one ULP HIGH under an unconditional ceil while #106629215 (post) demands it — an amendment boundary, exactly where rippled splits (rules().enabled(fixAMMv1_3), AMMHelpers getRoundedAsset). New amendment_enabled() reads the Amendments singleton straight off sandbox state, so every world — probe hydration, full-state replay, the live mirror — …
- **fix(xrpl-ledger): equal-withdraw fraction gates on WITHDRAW MODE, not amendment** (`4185a4a` , xrpl-validator) The census's second look ended the amendment theory: fixAMMv1_3 predates BOTH calibrators (active at #105880684 per the Amendments singleton on the wire). The true discriminator is the withdraw mode: tfWithdrawAll ceils the fraction (#106629211, both pool sides pinning it uniquely), tfLPToken partials keep the legacy nearest fraction (#105880685 one ULP HIGH under an unconditional ceil). withdraw_all threads through …
- **fix(xrpl-node): mirror speaks the engine's dialect — hexify addresses on every decode** (`02e0bbb` , xrpl-validator) Defect B, solved by its own field dump in one receipt: the engine's state convention is HEX account fields (every offline world — snapshot loader, probe hydration — runs hexify_addresses after decode), and hex-only parsers like check.rs parse_account_id read r-addresses as ABSENT. The live mirror inserted raw decoder output, so CheckCancel's creator compare failed as tecNO_PERMISSION on ledgers the replay proves …
- **fix(xrpl-node): shadow hydration — clear-before-fill and live-edge gating** (`9badf09` , xrpl-validator) v3's death, from its own log: hydration's 2-minute stall raises lag past the blob-fetch gate (lag<=25), the overlay vanishes for the catch-up ledgers, the next overlay ledger gaps past the mirror, the gap triggers re-hydration, and the loop repeats — while hydrate() INSERTED into the existing 19.8M-object map without clearing, so the second pass ~doubled RSS and the OOM killer ended the third (silent SIGKILL, no …

Tests and campaigns

- **test(xrpl-ledger): the 3 red regression tests encoded a 10 XRP reserve** (`751d5d4` , xrpl-validator)
- **test(xrpl-node): repeatable corpus sweep + restore the #105761560 fixture** (`6b3b87b` , xrpl-validator)

- **test(node): 5 coverage fixtures (AMM/Check/NFToken-accept) for engine-wide conformance map** (`f70baf9`, xrpl-validator)
- **test(node): arm scout find #105663160 — NFTokenAcceptOffer silent-TER parity gate** (`3bac75a`, xrpl-validator)
- **test(node): backlog parity gates — 6 divergence-lead ledger fixtures + generator** (`e34f42d`, xrpl-validator)

Docs and operations

- **Merge branch 'loop/differential-harness'** (`06c8658`, xrpl-validator)
- **revert(xrpl-ledger): back out the sell-trailing walk pending whole-offer-trial rev semantics — the probe hydration seed stays** (`6d90a33`, xrpl-validator)
- **docs: DirectStepI design — rippling through accounts, composed with book steps** (`b35031a`, xrpl-validator)
- **docs(xrpl-ledger): renumber StrandFlow citations against 3.2.1** (`60c1d81`, xrpl-validator)
- **docs(xrpl-ledger): cite 3.2.1, not the 3.1.3 vendor tree** (`8bbbae3`, xrpl-validator)
- **Revert "fix(ledger): remove the taker's own offer even when nothing crosses"** (`a0363a7`, xrpl-validator)
- **docs(xrpl-ledger): correct the stale directory.rs scope note** (`51f6fef`, xrpl-validator)
- **docs: honest README + PROGRESS — accurate architecture + status** (`34a549a`, xrpl-validator)
- **revert NFToken offer-ref parse (needs focused pass); keep AMM XRP+base58 encoding fix** (`51c9665`, xrpl-validator)
- **loop(succ): run report 20260716-145704 — SUCCESS** (`cdb0ffe`, xrpl-validator)
- **loop(succ): attempt 3 — RpcProvider::succ has no NFTokenPage awareness — rippled's page walk p** (`612d6be`, xrpl-validator)
- **loop(succ): attempt 2 — g1's two remaining mutation mismatches are pathed cross-currency Payme** (`64bef93`, xrpl-validator)
- **loop(succ): attempt 1 — On the standalone-RPC path pre-state capture for Modified keys consult** (`a344c2f`, xrpl-validator)
- **merge succ-loop: RpcProvider/LayeredProvider succ() directory walk (approved via Telegram)** (`892a9dc`, xrpl-validator)
- **loop(succ): run report 20260716-114254 — SUCCESS** (`e0c2976`, xrpl-validator)
- **loop(succ): attempt 2 — g2's remaining divergences stem from cross-currency Payments (6+ in le** (`dcc145c`, xrpl-validator)
- **loop(succ): attempt 1 — s2.ripple.com is Clio, which rejects ledger_data markers that aren't e** (`7ea2bdc`, xrpl-validator)
- **loop(succ): run report 20260716-112329 — HARNESS_ERROR** (`9206f5c`, xrpl-validator)
- **loop(succ): attempt 1 — RpcProvider/LayeredProvider succ can be implemented as a marker-seeded** (`bff9f3b`, xrpl-validator)

Independence program

No independence record for UTC day 2026-08-29; records begin 2026-10-20.

Network

No ledger records for this day: the reference node holds ledgers from 2026-10-04 22:52 UTC (#107,436,647).

Amendment watch

No amendment records for this day.

Corrections to earlier reports

None.

XRPL research

Automated research — candidate amendment ideas

Ideas generated and prior-art-checked by the XRPL Amendment Board, an automated research tool (read-only board: iceland.halcyon-names.io). They are exploration leads, not proposals.

- **Fractional NFT Co-Ownership via Vault Shares** (nft) Add a tfNFTokenVault flag to VaultCreate (SingleAssetVault) letting the funding deposit be a single locked NFTokenID instead of a fungible amount; the
- **Scoped, Expiring Multisign Session Entries** (accounts) Add three optional SFields to each SignerEntry inside an ExpandedSignerList — sfTxTypeMask (bitmap of allowed tt codes), sfMaxAmount, and sfExpiration
- **Consensus-Enforced Reserve Backing for MPT Issuers** (audit) Add sfReserveAccount (AccountID) and sfMinReserveBps SFields to MPTokenIssuance, set at MPTokenIssuanceCreate and immutable unless the issuance carrie

Appendix — commits

Committed	Merged into main	Repo	Commit	Subject
08-29 05:07	08-29 19:03	xrpl-validator	`c9dc9c2`	feat(xrpl-node): XRPL_REPLAY_TIMING=1 — per-ledger apply/hash phase receipts
08-29 19:03	08-29 19:03	xrpl-validator	`06c8658`	Merge branch 'loop/differential-harness'
08-28 22:41	08-29 19:03	xrpl-validator	`84b245c`	fix(xrpl-ledger): NFT transfer-fee royalty rounds half-even, not floor

Committed	Merged into main	Repo	Commit	Subject
08-28 22:15	08-29 19:03	xrpl-validator	`dffa32c`	fix(xrpl-node): probe fallback triggers on 'internal' — rippled masks lgrNotFound for non-admin
08-28 19:32	08-29 19:03	xrpl-validator	`46f139b`	feat(xrpl-ledger): BookStep requireAuth — unauth owners reaped, unauth pools yield no synthetic
08-28 17:26	08-29 19:03	xrpl-validator	`24c2d93`	fix(xrpl-node): probe s2 fallback retries transient failures
08-28 02:26	08-29 19:03	xrpl-validator	`1478907`	fix(xrpl-ledger): AMMVote applyVote ported for real — wrapped VoteEntry, VoteWeight from live LP balances, lowest-weight eviction, weighted-average TradingFee
08-28 01:39	08-29 19:03	xrpl-validator	`6d90a33`	revert(xrpl-ledger): back out the sell-trailing walk pending whole-offer-trial rev semantics — the probe hydration seed stays
08-28 00:29	08-29 19:03	xrpl-validator	`e6f0192`	fix(xrpl-ledger): a tfSell crossing's stream trails the whole in-limit book — trial past live offers, reap the dead — and probe book hydration seeds at the book base
08-25 12:55	08-29 19:03	xrpl-validator	`42616e0`	fix(xrpl-ledger): a missing escrow is tecNO_TARGET, not tecNO_ENTRY — EscrowFinish and EscrowCancel, all four sites
08-25 12:55	08-29 19:03	xrpl-validator	`f28a6eb`	fix(xrpl-ledger): AMM pool admission is context-dependent — fib-slice average under multiPath, raw spot single-path, keyed on iteration-entry multiPath — two hundred eighty consecutive ledgers
08-25 03:21	08-29 19:03	xrpl-validator	`527956b`	fix(xrpl-ledger): AccountSet asf-to-lsf is a table, not a shift — two hundred fifty-eight consecutive ledgers
08-25 01:21	08-29 19:03	xrpl-validator	`af8bd2f`	fix(xrpl-ledger): the strand ub composes hop-0 trIn and the final DirectI's issuing rate — two hundred forty consecutive ledgers
08-24 23:15	08-29 19:03	xrpl-validator	`390bff3`	fix(xrpl-ledger): the fwd chain carries the PRODUCED amount when the delta is exact, and a met-want hop flushes its excess input through the pool — two hundred thirty-nine consecutive ledgers
08-24 19:23	08-29 19:03	xrpl-validator	`d94dc7f`	fix(xrpl-ledger): strand admission is judged once per iteration — an un-attempted self-removal resets the level anchor — TWO HUNDRED TWENTY CONSECUTIVE LEDGERS, THE WHOLE FETCHED RANGE
08-24 18:21	08-29 19:03	xrpl-validator	`cbfc29a`	fix(xrpl-ledger): the crossing walk's remainingOut is StrandFlow's fold, never a running subtraction — two hundred seventeen consecutive ledgers
08-24 17:18	08-29 19:03	xrpl-validator	`7ec3a7c`	fix(xrpl-ledger): trustCreate NoRipple — creator side from the tx flags ONLY, peer side stamped when the PEER lacks DefaultRipple — two hundred eleven consecutive ledgers
08-24 16:15	08-29 19:03	xrpl-validator	`5485685`	fix(xrpl-ledger): the underfunded crossing clamp threads the balance as the walk's GROSS cap — two hundred six consecutive ledgers
08-24 14:09	08-29 19:03	xrpl-validator	`5d46894`	fix(xrpl-ledger): crossing removes self-offers past the strict threshold — but only in an ADMITTED strand — one hundred ninety-four consecutive ledgers
08-24 11:41	08-29 19:03	xrpl-validator	`8bef73f`	fix(xrpl-ledger): the delivered figure is rippled's actualOut — the sorted 16-digit fold, never an exact-width sum — one hundred ninety consecutive ledgers
08-24 10:35	08-29 19:03	xrpl-validator	`c88dc80`	fix(xrpl-ledger): tearing down a redeemed LP line charges ONLY the holder — one hundred eighty-six consecutive ledgers
08-24 04:23	08-29 19:03	xrpl-validator	`9885998`	fix(xrpl-ledger): a partial fib slice prices at the slice's CEIL-16 encoded quality — one hundred twenty consecutive ledgers, the range is clear
08-24 03:25	08-29 19:03	xrpl-validator	`737f067`	fix(xrpl-ledger): every spend-side net division is mulRatio-NEAREST — the live-line clamp was the fourth and last floor — one hundred sixteen consecutive ledgers
08-24 02:28	08-29 19:03	xrpl-validator	`afb53c1`	fix(xrpl-ledger): a book strand's sin is GROSS — the round loop drained the NET pot with it — one hundred seven consecutive ledgers
08-24 01:42	08-29 19:03	xrpl-validator	`b14b09a`	fix(xrpl-ledger): direct and run-tail asks take the NET twin verbatim — dividing the gross pot cannot recover it — eighty-four consecutive ledgers
08-24 00:59	08-29 19:03	xrpl-validator	`3b38011`	fix(xrpl-ledger): merge_pages sorts by compare_tokens, not whole-ID hex — eighty-one consecutive ledgers

Committed	Merged into main	Repo	Commit	Subject
08-24 00:05	08-29 19:03	xrpl-validator	`e4c1581`	fix(xrpl-ledger): the hop-joint net division is mulRatio-NEAREST, not floor — seventy-six consecutive ledgers
08-23 19:08	08-29 19:03	xrpl-validator	`a12ffd5`	fix(xrpl-ledger): gross_in is mulRatio and in-limited fills are GROSS-PRIMARY — the coupled spend-side campaign, seventy-five consecutive ledgers
08-23 17:53	08-29 19:03	xrpl-validator	`d882679`	fix(xrpl-ledger): a zero hop-carry delta with nonzero walk-accounting is a BLIND delta, not a dry hop — the self-fill face
08-23 16:46	08-29 19:03	xrpl-validator	`677f310`	feat(xrpl-ledger): limitOut quality-function trim, net-units judge, and per-iteration NET destination credits — seventy-two consecutive ledgers
08-23 15:11	08-29 19:03	xrpl-validator	`dae7e88`	fix(xrpl-ledger): payment remainders from savedOuts totals; want_gross via mulRatio; fee trim reuses the rev cache — sixty-seven consecutive ledgers
08-23 05:22	08-29 19:03	xrpl-validator	`4cffac5`	fix(xrpl-ledger): tfSell residual gets rounds half-even, not truncated — fifty-four consecutive ledgers
08-23 04:36	08-29 19:03	xrpl-validator	`808c980`	fix(xrpl-ledger): tecKILLED discards the OfferSequence cancel — fifty-three consecutive ledgers
08-23 02:13	08-29 19:03	xrpl-validator	`84a026e`	fix(xrpl-ledger): fwd hops reuse rev-stamped debt directions — fifty consecutive ledgers
08-23 01:16	08-29 19:03	xrpl-validator	`090b551`	fix(xrpl-ledger): a book redeems into the run behind it — forty-six consecutive ledgers
08-22 23:46	08-29 19:03	xrpl-validator	`84e17e0`	fix(xrpl-ledger): settle the taker once per quality level, not per fill — forty-four consecutive ledgers
08-22 21:32	08-29 19:03	xrpl-validator	`36feb4f`	fix(xrpl-ledger): tec rolls back the AccountTxnID stamp; delivery trim rounds nearest — forty consecutive ledgers
08-22 20:07	08-29 19:03	xrpl-validator	`fb798b3`	fix(xrpl-ledger): mulRatio requirements + blind-measurement guards — seventeen consecutive ledgers
08-22 16:11	08-29 19:03	xrpl-validator	`f37bf9d`	fix(xrpl-ledger): fresh multi-path verdict before the AMM turn — nine consecutive ledgers
08-22 14:57	08-29 19:03	xrpl-validator	`436102d`	fix(xrpl-ledger): single-path re-arbitration in the bridge controller — seven consecutive ledgers
08-22 04:26	08-29 19:03	xrpl-validator	`b7831e7`	fix(xrpl-ledger): four fill-precision fixes — six consecutive ledgers byte-for-byte
08-22 03:21	08-29 19:03	xrpl-validator	`26b2e2d`	fix(xrpl-ledger): tfSell residual rests the subtracted in-side, repriced out
08-22 02:56	08-29 19:03	xrpl-validator	`e84d0b3`	fix(xrpl-ledger): six mainnet-parity fixes from full-ledger replay rounds 2-3
08-22 02:02	08-29 19:03	xrpl-validator	`83858f9`	feat(node): state_replay — full-ledger native replay vs mainnet account_hash
08-21 23:26	08-29 19:03	xrpl-validator	`05de843`	feat(xrpl-node): state_verify — snapshot-dir account_hash verification
08-21 22:51	08-29 19:03	xrpl-validator	`9475a92`	fix(xrpl-ledger): self-cross deletions roll back with a failed strand — dead reaps stay banked
08-21 22:41	08-29 19:03	xrpl-validator	`1083ba5`	feat(xrpl-ledger): pseudo-transactions + flag-ledger NegativeUNL rotation — phase 4 opens
08-21 21:28	08-29 19:03	xrpl-validator	`1733d67`	feat(xrpl-ledger): byte backlog to ZERO — 98→0, ten fixtures byte-exact
08-21 16:46	08-29 19:03	xrpl-validator	`a0b42aa`	feat(xrpl-node): BYTE CENSUS — canonical-codec serialization vs ledger_entry binary=true
08-21 16:16	08-29 19:03	xrpl-validator	`6036cee`	feat(xrpl-ledger): XChain — all eight XLS-38 transactors; STUB_TYPES is EMPTY
08-21 16:05	08-29 19:03	xrpl-validator	`75b2517`	feat(xrpl-ledger): DID, PermissionedDomain, AMMClawback — five more stubs retired

Committed	Merged into main	Repo	Commit	Subject
08-21 12:45	08-29 19:03	xrpl-validator	`64ebb07`	feat(xrpl-ledger): MPT issuance lifecycle — Create/Destroy/Set/Authorize, stubs retired
08-21 12:20	08-29 19:03	xrpl-validator	`48367bc`	feat(xrpl-ledger): threadOwners — created/deleted nodes thread their owner roots
08-21 11:42	08-29 19:03	xrpl-validator	`9876271`	feat(xrpl-ledger): PreviousTxnID/PreviousTxnLgrSeq stamping + post-state threading census
08-21 03:20	08-29 19:03	xrpl-validator	`64c8246`	fix(xrpl-node): book hydration follows ledger_data markers — 400 pages, budgeted offers
08-20 21:43	08-29 19:03	xrpl-validator	`aa37f6b`	feat(xrpl-ledger): last-LP withdrawal deletes the AMM — lines, object, pool account
08-20 21:38	08-29 19:03	xrpl-validator	`1e9a2e4`	fix(xrpl-ledger): payment-mode AMM fills pay the IN-side transfer rate GROSS
08-20 21:26	08-29 19:03	xrpl-validator	`603a322`	fix(xrpl-ledger): model ISSUER-ONLY path elements (type 32) as same-currency cross-issuer books
08-20 20:41	08-29 19:03	xrpl-validator	`29b5ccb`	fix(xrpl-ledger): AMM offer generation reads pool balances ZERO-IF-FROZEN
08-20 19:45	08-29 19:03	xrpl-validator	`4ee4288`	feat(xrpl-ledger): anchored-slice bridged legs — single-path pool admission at SPOT, execution capped at the tip
08-20 19:20	08-29 19:03	xrpl-validator	`121869c`	feat(xrpl-ledger): MPT subsystem — direct MPT Payments and MPT Clawback
08-20 19:08	08-29 19:03	xrpl-validator	`56832be`	feat(xrpl-ledger): full PaymentChannel port — tfClose/tfRenew, expiry, keylet, hints
08-20 16:56	08-29 19:03	xrpl-validator	`2b1fc05`	fix(xrpl-ledger): engine-placed offers carry BookDirectory/BookNode/OwnerNode hints
08-20 16:56	08-29 19:03	xrpl-validator	`7965e2d`	fix(xrpl-ledger): four singles — CredentialAccept, SignerListSet, TrustSet, CheckCash
08-20 15:55	08-29 19:03	xrpl-validator	`6f72c88`	fix(xrpl-ledger): AMMWithdraw — LP line survives at zero unless default; issuer dir-tail hydration
08-20 15:45	08-29 19:03	xrpl-validator	`527b389`	fix(xrpl-ledger): NFT accept — seller-owns-token NoPermission, IOU-priced settlement, strict page bound
08-20 15:26	08-29 19:03	xrpl-validator	`e302884`	perf(xrpl-node): cache deterministic negative RPC lookups; share the HTTP client
08-20 05:40	08-29 19:03	xrpl-validator	`bb1ff88`	feat(xrpl-ledger): the flow driver — fib pace, zero-flow TER, consumed-trim stream, dead-level hydration
08-20 00:12	08-29 19:03	xrpl-validator	`520fc6b`	fix(xrpl-node): the probe recognizes threading-only ModifiedNodes that carry FinalFields
08-19 22:46	08-29 19:03	xrpl-validator	`46a9986`	fix(xrpl-ledger): tail admission is the residual-tip interval, not the anchored-slice quality
08-19 21:57	08-29 19:03	xrpl-validator	`09be43a`	fix(xrpl-ledger): a tfSell keeps taking pool liquidity after the pays minimum is met
08-19 21:37	08-29 19:03	xrpl-validator	`0a25745`	fix(xrpl-ledger): bridge peeks reap dead offers they step over once the strand is running
08-19 20:51	08-29 19:03	xrpl-validator	`cf9f395`	fix(xrpl-ledger): walk funding prices the reserve at the maker's first-peek OwnerCount
08-19 20:19	08-29 19:03	xrpl-validator	`60f425d`	fix(xrpl-ledger): the offer stream keeps reaping past the limit once the strand was built
08-19 19:38	08-29 19:03	xrpl-validator	`8f34f5c`	fix(xrpl-ledger): crossing tail AMM turn is gated by strand admission (anchored-at-limit ub × trIn)
08-19 19:23	08-29 19:03	xrpl-validator	`6f32591`	fix(xrpl-ledger): a skipped self-offer stays the tail AMM anchor; the trOut judge compose was wrong

Committed	Merged into main	Repo	Commit	Subject
08-19 17:49	08-29 19:03	xrpl-validator	`8d8079d`	fix(xrpl-ledger): single-path crossing lets the AMM emit unbounded when the limit beats the LOB tip
08-19 15:00	08-29 19:03	xrpl-validator	`0d4ce0f`	fix(xrpl-ledger): offer crossing judges the pass with the OUT issuer's transfer rate composed
08-19 12:57	08-29 19:03	xrpl-validator	`4771bdd`	feat(xrpl-ledger): the default path of a cross-issuer same-currency payment is a direct strand
08-19 12:22	08-29 19:03	xrpl-validator	`87bffeb`	feat(xrpl-ledger): DirectStepI stage 2 — direct runs composed with book hops
08-19 05:59	08-29 19:03	xrpl-validator	`f13ad50`	feat(xrpl-ledger): DirectStepI stage 1 — pure-account strands ripple for real
08-19 05:24	08-29 19:03	xrpl-validator	`b35031a`	docs: DirectStepI design — rippling through accounts, composed with book steps
08-19 05:03	08-29 19:03	xrpl-validator	`976d6e3`	fix(xrpl-ledger): AccountDelete has no OwnerCount rule — the directory walk decides
08-19 04:48	08-29 19:03	xrpl-validator	`24d983a`	fix(xrpl-ledger): AMMCreate preclaim — duplicate pool, reserve, funds, LP-token sides
08-19 04:27	08-29 19:03	xrpl-validator	`8c5e86b`	fix(xrpl-ledger): AMMWithdraw judges the DERIVED burn against the position, and the one-asset minimum
08-19 04:14	08-29 19:03	xrpl-validator	`442c34c`	fix(xrpl-ledger): TrustSet destination rules — no new lines at pseudo-accounts or opted-out issuers
08-19 03:55	08-29 19:03	xrpl-validator	`d57f139`	fix(xrpl-ledger): mint reserve gate must see the page insert too
08-19 03:27	08-29 19:03	xrpl-validator	`d86a69d`	fix(xrpl-ledger): an escrow whose deadline already passed is refused — and the token-escrow funds family
08-19 03:09	08-29 19:03	xrpl-validator	`d32160a`	fix(xrpl-ledger): OracleSet time rules — tecINVALID_UPDATE_TIME
08-19 02:48	08-29 19:03	xrpl-validator	`50d937e`	fix(xrpl-ledger): AMMVote refuses a voter who is not an LP
08-19 02:27	08-29 19:03	xrpl-validator	`c91e670`	fix(xrpl-ledger): AMMDeposit re-judges each ACTUAL amount before sending it
08-19 01:44	08-29 19:03	xrpl-validator	`2056087`	fix(xrpl-ledger): NFT accept judges the buyer's reserve when the transfer creates a page
08-19 00:45	08-29 19:03	xrpl-validator	`4ae3e03`	fix(xrpl-ledger): a mint that carries Amount inherits the OFFER's rules too
08-19 00:09	08-29 19:03	xrpl-validator	`12ddc7c`	fix: AMM zero-side refusal, NFTokenCancelOffer permissions, default-path book
08-18 19:07	08-29 19:03	xrpl-validator	`db5e428`	fix(xrpl-ledger): NoRipple on the destination's line blocks the step out of a book
08-18 18:23	08-29 19:03	xrpl-validator	`3e02ee6`	fix(xrpl-ledger): a credential is unlinked from BOTH directories, and the reserve follows acceptance
08-18 16:32	08-29 19:03	xrpl-validator	`92d8222`	fix(xrpl-ledger): cashing a check releases the check's own reserve
08-18 16:08	08-29 19:03	xrpl-validator	`39df833`	fix(xrpl-ledger): NFTokenModify checks mutability and the issuer's authorised minter
08-18 12:18	08-29 19:03	xrpl-validator	`74a4d42`	fix(xrpl-ledger): PaymentChannelCreate refuses DisallowIncomingPayChan and pseudo-accounts
08-18 04:04	08-29 19:03	xrpl-validator	`140d982`	fix(xrpl-ledger): a brokered accept must check BOTH offers' Destination
08-18 03:24	08-29 19:03	xrpl-validator	`2aa1274`	fix(xrpl-ledger): the bridged walk never crossed an expired offer either

Committed	Merged into main	Repo	Commit	Subject
08-18 02:59	08-29 19:03	xrpl-validator	`8ef6ea5`	feat(probe): DX_FILL on the bridged legs, and lift the saturating key cap
08-18 02:29	08-29 19:03	xrpl-validator	`6fb6cf7`	fix(xrpl-ledger): the strand upper bound charges the intermediate gateway's cut
08-18 01:26	08-29 19:03	xrpl-validator	`8e48764`	fix(xrpl-ledger): a pseudo-account cannot receive an escrow
08-17 22:21	08-29 19:03	xrpl-validator	`23f1153`	fix(xrpl-ledger): the balance clamps the GROSS, and a pass that misses limitQuality is discarded whole
08-17 20:00	08-29 19:03	xrpl-validator	`60c1d81`	docs(xrpl-ledger): renumber StrandFlow citations against 3.2.1
08-17 19:57	08-29 19:03	xrpl-validator	`8bbbae3`	docs(xrpl-ledger): cite 3.2.1, not the 3.1.3 vendor tree
08-17 04:22	08-29 19:03	xrpl-validator	`04d6c8b`	fix(xrpl-ledger): a terminal issuer-only change ripples between gateways, never a book
08-16 17:32	08-29 19:03	xrpl-validator	`a8b01c7`	fix(xrpl-ledger): a rested XRP residual rounds by mulRound, not by a plain ceiling
08-16 16:14	08-29 19:03	xrpl-validator	`1559d5f`	fix(xrpl-ledger): NFTokenBurn takes the token's OUTSTANDING OFFERS with it
08-16 14:59	08-29 19:03	xrpl-validator	`a31296a`	fix(xrpl-ledger): AccountDelete walks the owner DIRECTORY — OwnerCount 0 is not "owns nothing"
08-16 03:12	08-29 19:03	xrpl-validator	`91cdc47`	fix(xrpl-ledger): a tfSell FillOrKill completes on its FUNDED input, not on TakerGets
08-16 00:04	08-29 19:03	xrpl-validator	`e982148`	fix(xrpl-ledger): AMMWithdraw splits "no LP tokens" from "too few" — and the pool's own lines get hydrated
08-15 20:41	08-29 19:03	xrpl-validator	`51300d1`	feat(xrpl-ledger): DepositAuth — a payment needs the destination's permission
08-15 15:53	08-29 19:03	xrpl-validator	`b301e07`	fix(xrpl-ledger): AccountDelete removes the owner DIRECTORY, not just the account
08-15 14:55	08-29 19:03	xrpl-validator	`853e75a`	fix(xrpl-ledger): ceilOut CLAMPS the input to the offer's own, and either side at zero consumes it
08-15 13:53	08-29 19:03	xrpl-validator	`fbb4f96`	fix(harness): hydrate the NFT offer CREATOR's pages, not just the token's owner
08-15 04:26	08-29 19:03	xrpl-validator	`1a96950`	fix(xrpl-ledger): the AMM anchors only on a tip the taker could actually trade
08-15 01:40	08-29 19:03	xrpl-validator	`9c0d845`	fix(xrpl-ledger): NFTokenAcceptOffer weighs the buyer's funds — and the probe lets it see them
08-14 22:34	08-29 19:03	xrpl-validator	`950e63e`	fix(xrpl-ledger): every payment strand runs ONE PASS — corpus byte parity 0 hits
08-14 21:31	08-29 19:03	xrpl-validator	`bc756dd`	fix(xrpl-ledger): rippleSend moves the sender's line ONCE, with the gross
08-14 20:37	08-29 19:03	xrpl-validator	`ff1e752`	fix(xrpl-ledger): limitOut takes the STRICT canonicaliser when the drops decide
08-14 19:34	08-29 19:03	xrpl-validator	`7f8286b`	fix(xrpl-ledger): the bridge's direct head prices a partial fill at the filed rate
08-14 17:30	08-29 19:03	xrpl-validator	`4566c4e`	feat(xrpl-ledger): one AMM consumption per payment-engine iteration
08-14 16:31	08-29 19:03	xrpl-validator	`8d8d2e6`	fix(xrpl-ledger): ask the walk what a strand spent, don't difference the balance
08-14 14:26	08-29 19:03	xrpl-validator	`1f31546`	fix(xrpl-ledger): the precise measurement must account for the fee the walk debits

Committed	Merged into main	Repo	Commit	Subject
08-14 04:06	08-29 19:03	xrpl-validator	`45a7092`	fix(xrpl-ledger): measure the REVERSE pass's consumption precisely too
08-13 19:33	08-29 19:03	xrpl-validator	`afb133f`	fix(xrpl-ledger): reprice a rested remainder in BOTH directions
08-13 17:37	08-29 19:03	xrpl-validator	`44c20d9`	fix(xrpl-ledger): measure a hop's carry at full precision, not by differencing
08-13 16:05	08-29 19:03	xrpl-validator	`ca17418`	fix(xrpl-ledger): an INPUT-limited fill rounds the offer's output DOWN
08-13 07:40	08-29 19:03	xrpl-validator	`6798100`	fix(xrpl-ledger): stamount_signed_add ROUNDS its operands, not truncates
08-13 03:55	08-29 19:03	xrpl-validator	`070ca31`	fix(xrpl-ledger): reprice a rested remainder at the ENCODED ratio
08-12 22:38	08-29 19:03	xrpl-validator	`41ef4ac`	fix(xrpl-ledger): charge the input transfer fee once — the walk owns it
08-12 22:38	08-29 19:03	xrpl-validator	`e2a9c99`	fix(xrpl-ledger): price bridged fills at the filed BookDirectory rate
08-12 20:58	08-29 19:03	xrpl-validator	`4556384`	fix(xrpl-ledger): store offer residuals at STAmount precision, not exactly
08-12 18:36	08-29 19:03	xrpl-validator	`4a97124`	fix(xrpl-ledger): multiPath prices a clamped pool fill at the OFFER's quality
08-12 16:10	08-29 19:03	xrpl-validator	`cf36009`	fix(xrpl-ledger): the DIRECT walk charges the input issuer's transfer fee too
08-12 15:23	08-29 19:03	xrpl-validator	`81180a1`	fix(xrpl-ledger): withdraw-all pays two rounded steps, not a fused muldiv
08-12 14:36	08-29 19:03	xrpl-validator	`36a6fdb`	fix(xrpl-ledger): port rippled's Newton-iteration square root
08-12 13:37	08-29 19:03	xrpl-validator	`bbf6ee3`	fix(xrpl-ledger): a single-asset withdrawal pays what its adjusted tokens are worth
08-12 06:22	08-29 19:03	xrpl-validator	`e7183b3`	fix(xrpl-ledger): Number division DISCARDS its remainder at the 16-digit scale
08-12 04:00	08-29 19:03	xrpl-validator	`adca53a`	feat(xrpl-node): DX_VALCHECK compares EXACTLY, at STAmount precision
08-12 02:18	08-29 19:03	xrpl-validator	`df3c8f2`	fix(xrpl-ledger): an XRP residual ceils to whole DROPS, not to 16 digits
08-11 22:36	08-29 19:03	xrpl-validator	`6de2684`	fix(xrpl-ledger): to_amount honours round-to-NEAREST instead of flooring it
08-11 20:07	08-29 19:03	xrpl-validator	`94a028e`	fix(xrpl-ledger): a bridged taker pays the input issuer's transfer fee
08-11 17:53	08-29 19:03	xrpl-validator	`5c16b88`	fix(xrpl-ledger): a payment charges the input issuer's rate on EVERY hop
08-11 15:50	08-29 19:03	xrpl-validator	`dd4991a`	fix(xrpl-ledger): a fully-consumed offer transfers its own amounts verbatim
08-11 14:16	08-29 19:03	xrpl-validator	`5197c37`	fix(xrpl-ledger): a single-asset deposit pays what its adjusted tokens are worth
08-11 13:20	08-29 19:03	xrpl-validator	`c9ac386`	fix(xrpl-ledger): real LP token math for two-asset deposits and all withdrawals
08-11 03:23	08-29 19:03	xrpl-validator	`acf49ab`	fix(xrpl-ledger): quantize a deposit's LP mint to the pool balance's ulp
08-11 02:24	08-29 19:03	xrpl-validator	`85bb7df`	fix(xrpl-ledger): mint real LP tokens for AMMCreate and single-asset deposits

Committed	Merged into main	Repo	Commit	Subject
08-11 00:36	08-29 19:03	xrpl-validator	`25c9e31`	fix(xrpl-node): choose the hydration RPC per LEDGER, not per sweep script
08-10 17:03	08-29 19:03	xrpl-validator	`b2c47da`	fix(xrpl-ledger): match rippled's AMM slice sizing on direct offer crossing
08-10 14:25	08-29 19:03	xrpl-validator	`c99ebb2`	fix(xrpl-ledger): a payment pays the INPUT issuer's TransferRate
08-10 05:37	08-29 19:03	xrpl-validator	`07f2e32`	fix(xrpl-ledger): reprice bridged leg A after the mid-leg rounds up
08-10 03:53	08-29 19:03	xrpl-validator	`9bb5ceb`	fix(xrpl-ledger): the bridged XRP mid-leg must CEIL to whole drops, not truncate
08-10 02:50	08-29 19:03	xrpl-validator	`9e475fe`	feat(xrpl-ledger): DX_CLAMP — and it retires the ceil_in flip for good
08-10 02:47	08-29 19:03	xrpl-validator	`5aad67e`	fix(xrpl-node): prefetch NFT pages for NFTokenModify — it is tt 61, not 25..=29
08-10 01:59	08-29 19:03	xrpl-validator	`6ef30c4`	fix(xrpl-ledger): token escrow — Cancel and Finish never released the token
08-09 19:17	08-29 19:03	xrpl-validator	`c7d4625`	feat(xrpl-node): FFI_VALCHECK — the oracle rule now works at VALUE level
08-09 17:22	08-29 19:03	xrpl-validator	`0f55ba5`	fix(xrpl-ledger): rank payment strands by UPPER BOUND, not by a realised trial
08-09 01:36	08-29 19:03	xrpl-validator	`868cf89`	feat(xrpl-ledger): one strand per named path, and stop gating hops with the payment's limit
08-08 23:30	08-29 19:03	xrpl-validator	`a56ccbd`	fix(xrpl-ledger): NFTokenCreateOffer never charged for the object it creates
08-08 22:17	08-29 19:03	xrpl-validator	`850da82`	fix(xrpl-ledger): a rested residual keeps its ORIGINAL quality in its AMOUNTS
08-08 18:03	08-29 19:03	xrpl-validator	`9bc95c8`	feat(xrpl-node): DX_VALCHECK — compare the VALUES we wrote, not just the keys
08-08 15:34	08-29 19:03	xrpl-validator	`5dc7cb7`	fix(xrpl-ledger): a bridge leg-B maker cannot deliver more than it holds
08-08 11:36	08-29 19:03	xrpl-validator	`125be81`	fix(xrpl-ledger): size the reverse-pass grant to the requirement it measures
08-08 10:49	08-29 19:03	xrpl-validator	`7d785ec`	fix(xrpl-ledger): tfNoRippleDirect forbids the strand we fall back to
08-08 10:04	08-29 19:03	xrpl-validator	`89bed1e`	fix(xrpl-ledger): the reverse pass must size for the pass the forward one runs
08-08 07:59	08-29 19:03	xrpl-validator	`b569fa9`	fix(xrpl-ledger): destination checks across every transactor that has them
08-08 05:13	08-29 19:03	xrpl-validator	`3033135`	fix(xrpl-ledger): limitOut sizes a pass TO the limit — #106134431 closed 122/122
08-08 04:14	08-29 19:03	xrpl-validator	`3180e04`	fix(xrpl-ledger): single-path AMM takes maxOffer, clamped through the pool BOTH ways
08-08 03:08	08-29 19:03	xrpl-validator	`a171405`	feat(xrpl-ledger): max_offer — rippled's single-path AMM slice, trace-exact
08-07 22:00	08-29 19:03	xrpl-validator	`8d8ca2d`	fix(xrpl-ledger): a payment crosses the payer's own offer
08-07 21:17	08-29 19:03	xrpl-validator	`5626357`	fix(xrpl-ledger): destination checks come before the funding check
08-07 18:36	08-29 19:03	xrpl-validator	`17a99ef`	refactor(xrpl-ledger): remove DX_SEL — it now compares an abandoned model

Committed	Merged into main	Repo	Commit	Subject
08-07 16:13	08-29 19:03	xrpl-validator	`60fb653`	fix(xrpl-node): prefetch the NFT offer's OWNER — the accept names it by hash
08-07 14:53	08-29 19:03	xrpl-validator	`a191b79`	fix(xrpl-node): the FFI oracle replayed every old fixture under TODAY'S rules
08-07 13:46	08-29 19:03	xrpl-validator	`751d5d4`	test(xrpl-ledger): the 3 red regression tests encoded a 10 XRP reserve
08-07 05:10	08-29 19:03	xrpl-validator	`f2d9d9a`	feat(xrpl-ledger): DX_ULP — the 1-ulp upper bound is unobservable, and the note was backwards
08-07 01:40	08-29 19:03	xrpl-validator	`a836f94`	fix(xrpl-ledger): a rejected candidate's offer removals must survive its rollback
08-06 23:52	08-29 19:03	xrpl-validator	`03c2cb9`	fix(xrpl-ledger): strand selection — upper-bound order with fall-through
08-06 22:41	08-29 19:03	xrpl-validator	`005ad9a`	fix(xrpl-ledger): the bridge strand's upper bound must not charge the transfer fee
08-06 21:48	08-29 19:03	xrpl-validator	`dbb9110`	feat(xrpl-ledger): DX_SEL — measure strand selection against rippled's model
08-06 18:47	08-29 19:03	xrpl-validator	`f3f8b98`	fix(xrpl-ledger): auth is not an interest in a trust line
08-06 13:46	08-29 19:03	xrpl-validator	`44d7a1c`	fix(ledger): a hydrated maker with no line for what it sells holds ZERO
08-06 05:44	08-29 19:03	xrpl-validator	`cae6b85`	fix(probe): a dropped fetch is not a divergence — withhold the verdict
08-06 03:59	08-29 19:03	xrpl-validator	`7ff7a13`	fix(ledger): price an IN-limited fill through the encoded quality too
08-06 02:12	08-29 19:03	xrpl-validator	`178e853`	fix(ledger): one flow-wide AMM fib counter in cross_bridged, not one per leg
08-06 01:04	08-29 19:03	xrpl-validator	`c89601c`	fix(probe): load the tail's predecessor page, and compare pointers by VALUE
08-05 21:10	08-29 19:03	xrpl-validator	`64dc440`	fix(ledger): per-fib-slice AMM granularity in the multi-strand payment loop
08-05 18:47	08-29 19:03	xrpl-validator	`f0f311e`	feat(ledger): DX_PAY round line before the loop's breaks
08-05 18:03	08-29 19:03	xrpl-validator	`0144f50`	fix(ffi): route the registry journal to the capturing sink so Payments trace
08-05 15:56	08-29 19:03	xrpl-validator	`9426fbe`	fix(ledger): price an out-limited fill through the offer's encoded quality
08-05 04:23	08-29 19:03	xrpl-validator	`01c41a0`	fix(ledger): a single-path leg is priced by its pool's SPOT quality
08-04 22:37	08-29 19:03	xrpl-validator	`40cabb2`	feat(ledger): DX_HEADS/DX_RAWHEADS — per-leg book heads in the bridged walk
08-04 21:46	08-29 19:03	xrpl-validator	`37d5625`	fix(ledger): the stream's dead tests apply to the taker's own offer too
08-04 15:25	08-29 19:03	xrpl-validator	`edf469a`	fix(ledger): a bridged leg's pool prices the strand only while two are active
08-04 05:30	08-29 19:03	xrpl-validator	`b18410f`	fix(ledger): price an AMM bridge leg at the amount that actually flows
08-03 17:11	08-29 19:03	xrpl-validator	`8152aca`	fix(ledger): one AMM turn per pass, and a rejected pass ends the crossing
08-03 16:09	08-29 19:03	xrpl-validator	`133fd89`	fix(ledger): judge a fill's achieved quality exactly, as rippled does

Committed	Merged into main	Repo	Commit	Subject
08-03 15:22	08-29 19:03	xrpl-validator	`d6f7589`	fix(ledger): round a fill's XRP input by which side bounds it
08-03 14:21	08-29 19:03	xrpl-validator	`8b5a197`	feat(ffi): capture libxrpl's decision trace under XRPL_FFI_TRACE
08-03 05:27	08-29 19:03	xrpl-validator	`9ac6bcc`	feat(ledger): reverse pass — size each payment hop to what the next needs
08-03 05:26	08-29 19:03	xrpl-validator	`6e631e7`	fix(ledger): the POOL can activate a strand, and an active strand reaps
08-03 03:30	08-29 19:03	xrpl-validator	`99f8a7a`	feat(ledger): flow the default path alongside Paths, per pass
08-03 02:41	08-29 19:03	xrpl-validator	`c858f1f`	refactor(ledger): one strand code path in Payment
08-03 01:56	08-29 19:03	xrpl-validator	`a533219`	feat(ledger): AMMDeposit tfTwoAsset equalDepositLimit + tecAMM_FAILED
08-02 15:41	08-29 19:03	xrpl-validator	`7efe2fd`	fix(ledger): measure a payment hop's carry, don't subtract a sentinel
08-02 04:49	08-29 19:03	xrpl-validator	`b733ae7`	fix(ledger): remove self-crossed offers off the book tip
08-02 03:52	08-29 19:03	xrpl-validator	`be244f0`	fix(ledger): CredentialCreate joins both owner directories
08-02 03:08	08-29 19:03	xrpl-validator	`4bac28e`	fix(ledger): apply tfSetfAuth to the trust line
08-01 20:16	08-29 19:03	xrpl-validator	`d5a08c8`	fix(ledger): align IOU addition the way STAmount does
08-01 19:26	08-29 19:03	xrpl-validator	`549abb1`	fix(probe): hydrate trust lines for the currencies named in Paths
08-01 18:07	08-29 19:03	xrpl-validator	`9a82325`	fix(ledger): split a full NFToken page before inserting
08-01 05:56	08-29 19:03	xrpl-validator	`761df02`	fix(ledger): consolidate NFToken pages when a removal shrinks one
07-31 19:20	08-29 19:03	xrpl-validator	`e12436b`	fix(ledger): tfOneAssetWithdrawAll empties the LP position
07-31 17:42	08-29 19:03	xrpl-validator	`a0363a7`	Revert "fix(ledger): remove the taker's own offer even when nothing crosses"
07-31 17:20	08-29 19:03	xrpl-validator	`70ea97e`	fix(ledger): remove the taker's own offer even when nothing crosses
07-31 16:00	08-29 19:03	xrpl-validator	`a67eeca`	fix(ledger): enforce lsfRequireAuth on the receiving trust line
07-31 15:51	08-29 19:03	xrpl-validator	`aaf0c79`	fix(ledger): CredentialDelete needs only one of Subject/Issuer
07-31 15:51	08-29 19:03	xrpl-validator	`5582a93`	fix(ledger): funding outranks expiry in OfferCreate preclaim
07-31 02:08	08-29 19:03	xrpl-validator	`e10fe45`	fix(probe): hydrate the ISSUERS' owner directories for OfferCreate
07-30 18:24	08-29 19:03	xrpl-validator	`413368a`	fix(ledger): a bridge leg with a pool but no book carries nothing
07-30 17:26	08-29 19:03	xrpl-validator	`95eb59c`	fix(ledger): pass the page hint when a payment tears down a trust line
07-30 16:26	08-29 19:03	xrpl-validator	`e7b7d4d`	fix(ledger): AMMWithdraw by LPTokenIn pays out both pool assets

Committed	Merged into main	Repo	Commit	Subject
07-30 15:02	08-29 19:03	xrpl-validator	`2488343`	feat(ledger): NFTokenMint carrying Amount also rests a sell offer
07-29 14:01	08-29 19:03	xrpl-validator	`d753d7a`	fix(ledger): OfferCreate reserve is pre-fee, and expiry precedes it
07-28 14:13	08-29 19:03	xrpl-validator	`52a567d`	fix(differential_probe): put the RPC server in the cache key
07-28 13:30	08-29 19:03	xrpl-validator	`11a9c6c`	fix(xrpl-ledger): an AMM deposit must fund its XRP side after reserve
07-28 13:08	08-29 19:03	xrpl-validator	`5704d68`	feat(xrpl-ledger): token escrow, and give escrows their directory entries
07-28 12:38	08-29 19:03	xrpl-validator	`cce3c8d`	fix(xrpl-ledger): cap a direct IOU payment at what the destination can receive
07-28 12:06	08-29 19:03	xrpl-validator	`edf4462`	fix(xrpl-ledger): finish CheckCreate's destination checks
07-28 04:28	08-29 19:03	xrpl-validator	`8b23677`	fix(xrpl-ledger): honour the NFT offer opt-out on Owner and Destination
07-28 03:18	08-29 19:03	xrpl-validator	`1c46cda`	fix(xrpl-ledger): a frozen holder can fund nothing
07-28 01:50	08-29 19:03	xrpl-validator	`625399c`	fix(xrpl-ledger): a bridged pass needs its book composition within the limit
07-28 01:15	08-29 19:03	xrpl-validator	`1edaa63`	fix(xrpl-ledger): tick re-derivation divides with the STAmount rule
07-28 00:22	08-29 19:03	xrpl-validator	`bb522bf`	fix(xrpl-ledger): a crossing that exhausts the account rests no remainder
07-27 23:45	08-29 19:03	xrpl-validator	`ba73d4f`	fix(xrpl-ledger): carry the trailing reap across book levels
07-27 23:22	08-29 19:03	xrpl-validator	`130c246`	fix(xrpl-ledger): step past a satisfied fill, and reap dust-backed offers
07-27 17:07	08-29 19:03	xrpl-validator	`51f6fef`	docs(xrpl-ledger): correct the stale directory.rs scope note
07-27 17:06	08-29 19:03	xrpl-validator	`01f09ba`	fix(xrpl-ledger): reap a book level's dead offers before consulting the pool
07-26 17:25	08-29 19:03	xrpl-validator	`f6ed033`	fix(clawback): decode the base58 holder from Amount.issuer
07-26 16:43	08-29 19:03	xrpl-validator	`881e160`	fix(nftoken): decode the base58 Issuer field on authorised-minter mints
07-26 13:32	08-29 19:03	xrpl-validator	`34a549a`	docs: honest README + PROGRESS — accurate architecture + status
07-26 01:02	08-29 19:03	xrpl-validator	`7eb0dca`	fix(differential_probe): hydrate the issuer's owner-dir tail for CheckCash
07-25 22:57	08-29 19:03	xrpl-validator	`a7bd6a0`	fix(xrpl-ledger): implement AMMWithdraw tfWithdrawAll teardown
07-25 20:13	08-29 19:03	xrpl-validator	`77f6f39`	fix(xrpl-ledger): honour tfPassive -- don't consume equal-quality makers
07-25 17:01	08-29 19:03	xrpl-validator	`7e592e9`	fix(xrpl-ledger): re-check a maker's actual quality, not just its book page
07-25 14:38	08-29 19:03	xrpl-validator	`84898d4`	fix(xrpl-ledger): cross an underfunded maker at book quality, don't rest
07-25 12:37	08-29 19:03	xrpl-validator	`04a1586`	fix(xrpl-ledger): cap payment delivery at the destination's trust limit

Committed	Merged into main	Repo	Commit	Subject
07-24 21:45	08-29 19:03	xrpl-validator	`34fca11`	fix(xrpl-ledger): honour keepRoot when a directory page empties
07-24 21:45	08-29 19:03	xrpl-validator	`b79f40f`	fix(xrpl-ledger): CheckCancel unlinks the Check from both owner directories
07-24 21:01	08-29 19:03	xrpl-validator	`1de6d87`	fix(xrpl-ledger): OfferCreate crossing spends only accountFunds, not TakerGets
07-24 14:47	08-29 19:03	xrpl-validator	`3a718aa`	fix(xrpl-ledger): a Payment to a pseudo-account is tecNO_PERMISSION
07-24 13:46	08-29 19:03	xrpl-validator	`609c827`	fix(xrpl-ledger): CheckCash requires exactly one of Amount / DeliverMin
07-24 03:54	08-29 19:03	xrpl-validator	`a823d98`	fix(xrpl-ledger): reject offers by achieved quality and skip expired ones; keep the cleanup on tecKILLED
07-24 03:10	08-29 19:03	xrpl-validator	`eb19a38`	feat(xrpl-ledger): DX_BOOK trace for the book walk's quality gate
07-24 03:05	08-29 19:03	xrpl-validator	`ce27e48`	fix(xrpl-ledger): tecOBJECT_NOT_FOUND for missing NFT offers, tecAMM_BALANCE for over-withdraw
07-24 02:35	08-29 19:03	xrpl-validator	`08515b3`	fix(xrpl-ledger): correct the credential keylet, allow self-issuance, hydrate it
07-24 02:35	08-29 19:03	xrpl-validator	`bfc83f9`	fix(xrpl-ledger): merging past an oracle's ten-entry cap is tecARRAY_TOO_LARGE
07-24 02:34	08-29 19:03	xrpl-validator	`3cebd6a`	fix(xrpl-ledger): AccountDelete fee is one owner reserve, read from the ledger
07-24 01:29	08-29 19:03	xrpl-validator	`2b1beae`	fix(xrpl-ledger): charge the issuer's TransferRate on payment delivery
07-24 00:20	08-29 19:03	xrpl-validator	`e27d088`	fix(xrpl-ledger): a payment cannot open the destination's trust line
07-23 23:37	08-29 19:03	xrpl-validator	`84ced29`	fix(xrpl-ledger): no AMM liquidity in permissioned-domain books — corpus 100%
07-23 23:06	08-29 19:03	xrpl-validator	`6b3b87b`	test(xrpl-node): repeatable corpus sweep + restore the #105761560 fixture
07-23 23:06	08-29 19:03	xrpl-validator	`4a36c48`	fix(xrpl-ledger): payments never autobridge — AMM over-mutation via a synthesized XRP leg
07-23 20:37	08-29 19:03	xrpl-validator	`a6ef95a`	fix(xrpl-ledger): direct IOU payment requires an existing destination trust line
07-23 16:03	08-29 19:03	xrpl-validator	`385e129`	fix(xrpl-ledger): AMMDeposit owner-reserve guard for zero-LPToken depositors
07-23 15:28	08-29 19:03	xrpl-validator	`bcf7e5c`	fix(xrpl-ledger): enforce owner reserve on object creation — TicketCreate + TrustSet
07-22 16:11	08-29 19:03	xrpl-validator	`0a4d4f5`	fix(xrpl-ledger): NFTokenCreateOffer token-existence preclaim + sandbox create-then-delete nets to nothing — 2 fresh-traffic finds
07-21 23:39	08-29 19:03	xrpl-validator	`c333d93`	feat(xrpl-ledger): per-leg AMM liquidity in bridged crossing — CORPUS 100% (1109/1109)
07-21 23:30	08-29 19:03	xrpl-validator	`f2d2bcb`	feat(xrpl-ledger): multi-path FIB AMM offers in bridged crossing — corpus stable 1107/1109
07-21 23:11	08-29 19:03	xrpl-validator	`020c568`	feat(xrpl-ledger): issuer account-hops, endpoint dedup, in-flight hygiene — all corpus payments match — corpus 99.8%
07-21 22:56	08-29 19:03	xrpl-validator	`96dcd62`	feat(xrpl-ledger): rippled QualityFunction limit-trim for AMM fills — corpus 99.5%
07-21 22:28	08-29 19:03	xrpl-validator	`7d51d97`	fix(xrpl-ledger): me_muldiv 16-digit quotient scaling; AMM fee-adjusted spot; AMM turn in bridged crossing — corpus 99.3%

Committed	Merged into main	Repo	Commit	Subject
07-21 21:57	08-29 19:03	xrpl-validator	`7111b1f`	feat(xrpl-ledger): XRP autobridging for IOU↔IOU crossing; sender-reserve funding check — corpus 99.2%
07-21 21:35	08-29 19:03	xrpl-validator	`a146364`	feat(xrpl-ledger): full AMM lifecycle parity — Create/Deposit/Withdraw on real legs — corpus 99.1%
07-21 21:30	08-29 19:03	xrpl-validator	`13197e6`	feat(xrpl-ledger): Number-exact rounding, XLS-80 domain books, multi-hop payment strands, real reserve — corpus 98.8%
07-21 19:19	08-29 19:03	xrpl-validator	`454d6c6`	feat(xrpl-ledger): real NFTokenPage model — mint/burn/accept/cancel/modify on structural page keys — corpus 98.2%
07-21 19:04	08-29 19:03	xrpl-validator	`d28de50`	feat(xrpl-ledger): real TicketCreate + OracleSet/OracleDelete transactors; tecDST_TAG_NEEDED — corpus 97.5%
07-21 13:01	08-29 19:03	xrpl-validator	`a585ce8`	feat(node): differential_probe RPC disk cache — immutable historical lookups, DX_CACHE override
07-21 01:19	08-29 19:03	xrpl-validator	`5b1d386`	fix(xrpl-ledger): faithful OfferCreate preclaim funding — tecUNFUNDED_OFFER — corpus 96.8%
07-20 23:49	08-29 19:03	xrpl-validator	`870eefd`	fix(xrpl-ledger): sell-side offer funding check — tecUNFUNDED_OFFER — corpus 96.8%
07-20 22:19	08-29 19:03	xrpl-validator	`3a3f337`	feat(xrpl-ledger): tfSell crossing semantics — sell the whole TakerGets — corpus 96.3%
07-20 20:28	08-29 19:03	xrpl-validator	`d547205`	fix(xrpl-ledger): trust-line lifecycle — receiver-only reserve, NoRipple, zero-balance deletion — corpus 95.6%
07-20 16:04	08-29 19:03	xrpl-validator	`bb1eefa`	fix(xrpl-ledger): route strand output to the destination — corpus 95.6%
07-20 14:24	08-29 19:03	xrpl-validator	`a5db381`	fix(xrpl-ledger): issuer TickSize in offer placement — corpus 95.0%
07-20 00:12	08-29 19:03	xrpl-validator	`18d4a00`	feat(xrpl-ledger): AMM swap engine — corpus 94.1%, the third summit
07-19 19:50	08-29 19:03	xrpl-validator	`28f0cb6`	fix(xrpl-ledger): path payments — quality gate only under tfLimitQuality, DeliverMin floor, book pre-state — corpus 90.3%
07-19 16:29	08-29 19:03	xrpl-validator	`02508d9`	feat(xrpl-ledger): CheckCash via transfer engine + tec classification — corpus 90%
07-19 15:58	08-29 19:03	xrpl-validator	`a4dc8d7`	feat(xrpl-ledger): CheckCash via shared transfer engine — IOU checks + tecPATH_PARTIAL semantics
07-19 14:43	08-29 19:03	xrpl-validator	`e6efe32`	feat(xrpl-ledger): IOU + cross-currency payment engine — second summit
07-19 13:34	08-29 19:03	xrpl-validator	`f5b87b2`	fix(xrpl-ledger): cancel-and-replace + funded-check starvation — OfferCreate 64%
07-19 12:38	08-29 19:03	xrpl-validator	`7ee6dcd`	feat(xrpl-ledger): integer offer-crossing engine — the summit assault
07-19 11:40	08-29 19:03	xrpl-validator	`150c432`	feat(xrpl-ledger): order-book quality keylet + OfferCreate placement — base camp
07-18 20:57	08-29 19:03	xrpl-validator	`ad0f628`	feat(xrpl-ledger): ticket consumption in apply_common — OfferCancel 19/19
07-18 16:35	08-29 19:03	xrpl-validator	`e93b4b3`	feat(xrpl-ledger): CheckCreate + NFTokenCreateOffer parity — 5 fully-green types
07-17 23:50	08-29 19:03	xrpl-validator	`270345a`	feat(xrpl-ledger): OfferCancel directory unlinking — 6/6 MATCH across two ledgers
07-17 23:20	08-29 19:03	xrpl-validator	`87d6ff7`	feat(xrpl-ledger): trust-line deletion + oracle state threading — TrustSet 14/14 MATCH
07-17 21:43	08-29 19:03	xrpl-validator	`a22af92`	feat: multi-page owner directory + load native-read keys — TrustSet 1->10 MATCH

Committed	Merged into main	Repo	Commit	Subject
07-17 21:29	08-29 19:03	xrpl-validator	`274d420`	feat(ledger): owner-directory bookkeeping (single root page) + wire into TrustSet
07-17 21:11	08-29 19:03	xrpl-validator	`51c9665`	revert NFToken offer-ref parse (needs focused pass); keep AMM XRP+base58 encoding fix
07-17 20:47	08-29 19:03	xrpl-validator	`31735dc`	fix(ledger): NFTokenAcceptOffer reads offer ref as hex ledger-index, not {Account,Sequence}
07-17 20:43	08-29 19:03	xrpl-validator	`330ed4d`	feat(node): differential_probe loads pre-state objects (not just AccountRoots)
07-17 20:27	08-29 19:03	xrpl-validator	`fdca115`	fix(ledger): TrustSet decodes base58 issuer (was hex-only → every real tx temMALFORMED)
07-17 20:16	08-29 19:03	xrpl-validator	`f70baf9`	test(node): 5 coverage fixtures (AMM/Check/NFToken-accept) for engine-wide conformance map
07-17 19:40	08-29 19:03	xrpl-validator	`9cfb9af`	fix(node): differential_probe --json emits only JSON (SUMMARY to stderr); re-mint sample fixtures with tx_json
07-17 19:34	08-29 19:03	xrpl-validator	`c862c37`	feat(node): differential_probe — measure native engine vs mainnet parity
07-17 17:04	08-29 19:03	xrpl-validator	`8ed5545`	feat(node): network-parameterized replay — NetParams for testnet/devnet parity probes
07-17 15:57	08-29 19:03	xrpl-validator	`3bac75a`	test(node): arm scout find #105663160 — NFTokenAcceptOffer silent-TER parity gate
07-17 15:07	08-29 19:03	xrpl-validator	`52e9df5`	feat(node): parity_probe bin — runtime fixture replay for the scout loop
07-16 20:19	08-29 19:03	xrpl-validator	`cdb0ffe`	loop(succ): run report 20260716-145704 — SUCCESS
07-16 19:56	08-29 19:03	xrpl-validator	`612d6be`	loop(succ): attempt 3 — RpcProvider::succ has no NFTokenPage awareness — rippled's page walk p
07-16 19:34	08-29 19:03	xrpl-validator	`64bef93`	loop(succ): attempt 2 — g1's two remaining mutation mismatches are pathed cross-currency Payme
07-16 19:12	08-29 19:03	xrpl-validator	`a344c2f`	loop(succ): attempt 1 — On the standalone-RPC path pre-state capture for Modified keys consult
07-16 18:13	08-29 19:03	xrpl-validator	`e34f42d`	test(node): backlog parity gates — 6 divergence-lead ledger fixtures + generator
07-16 17:54	08-29 19:03	xrpl-validator	`892a9dc`	merge succ-loop: RpcProvider/LayeredProvider succ() directory walk (approved via Telegram)
07-16 16:40	08-29 19:03	xrpl-validator	`e0c2976`	loop(succ): run report 20260716-114254 — SUCCESS
07-16 16:25	08-29 19:03	xrpl-validator	`dcc145c`	loop(succ): attempt 2 — g2's remaining divergences stem from cross-currency Payments (6+ in le
07-16 16:10	08-29 19:03	xrpl-validator	`7ea2bdc`	loop(succ): attempt 1 — s2.ripple.com is Clio, which rejects ledger_data markers that aren't e
07-16 15:40	08-29 19:03	xrpl-validator	`9206f5c`	loop(succ): run report 20260716-112329 — HARNESS_ERROR
07-16 15:40	08-29 19:03	xrpl-validator	`bff9f3b`	loop(succ): attempt 1 — RpcProvider/LayeredProvider succ can be implemented as a marker-seeded
07-15 11:34	08-29 19:03	xrpl-validator	`23a76a8`	fix(node): era-guard FFI verify + never keep unverifiable the validator's ledger feed writes
07-10 12:15	08-29 19:03	xrpl-validator	`5ea6c9e`	fix(node): hold the validator's ledger feed position on unapplied ledger instead of skipping
08-29 19:20	08-29 19:20	xrpl-validator	`2d66eb0`	feat(xrpl-node): Stage 4 Phase A — native-engine shadow leg (XRPL_NATIVE_SHADOW=1)

Committed	Merged into main	Repo	Commit	Subject
08-29 19:31	08-29 19:31	xrpl-validator	`02465de`	fix(xrpl-node): shadow leg stamps threading — first-light lesson
08-29 19:53	08-29 19:53	xrpl-validator	`fcb7b3a`	feat(xrpl-node): shadow receipts name their classes — typed missing keys, stale-mirror audits, reconcile-leak verifier
08-29 21:35	08-29 21:35	xrpl-validator	`032f9c3`	fix(xrpl-ledger): funds-exhausting fill sizes from the gross-cap chain, not the rem_gets accumulator
08-29 21:35	08-29 21:35	xrpl-validator	`c53b5af`	fix(xrpl-ledger): funds-exhausting fill sizes from the gross-cap chain, not the rem_gets accumulator
08-29 22:59	08-29 22:59	xrpl-validator	`bf4a729`	fix(xrpl-ledger): equal-withdraw fraction ceils, asset products floor
08-29 23:34	08-29 23:34	xrpl-validator	`0ac8d7e`	fix(xrpl-ledger): AMMVote — default-zero omission and AuctionSlot DiscountedFee
08-29 23:35	08-29 23:35	xrpl-validator	`d57e19b`	feat(xrpl-node): shadow dumps the engine's-eye tx on first per-ledger TER mismatch
08-30 00:53	08-30 00:53	xrpl-validator	`c26156a`	fix(xrpl-ledger): equal-withdraw fraction ceil gates on fixAMMv1_3
08-30 02:03	08-30 02:03	xrpl-validator	`4185a4a`	fix(xrpl-ledger): equal-withdraw fraction gates on WITHDRAW MODE, not amendment
08-30 03:08	08-30 03:08	xrpl-validator	`02e0bbb`	fix(xrpl-node): mirror speaks the engine's dialect — hexify addresses on every decode
08-30 03:20	08-30 03:20	xrpl-validator	`9badf09`	fix(xrpl-node): shadow hydration — clear-before-fill and live-edge gating
